

Important Information

Thank you for choosing Freenove products!

Getting Started

First, please read the **Read Me First.pdf** document in the unzipped folder you created.

If you have not yet downloaded the zip file, associated with this kit, please do so now and unzip it.

Get Support and Offer Input

Freenove provides free and responsive product and technical support, including but not limited to:

- Product quality issues
- Product use and build issues
- Questions regarding the technology employed in our products for learning and education
- Your input and opinions are always welcome
- We also encourage your ideas and suggestions for new products and product improvements

For any of the above, you may send us an email to:

support@freenove.com

Safety and Precautions

Please follow the following safety precautions when using or storing this product:

- Keep this product out of the reach of children under 6 years old.
- This product should be **used only when there is adult supervision present** as young children lack necessary judgment regarding safety and the consequences of product misuse.
- This product contains small parts and parts, which are sharp. This product contains electrically conductive parts. **Use caution with electrically conductive parts near or around power supplies, batteries and powered (live) circuits.**
- When the product is turned ON, activated or tested, some parts will move or rotate. **To avoid injuries to hands and fingers keep them away from any moving parts!**
- It is possible that an improperly connected or shorted circuit may cause overheating. **Should this happen, immediately disconnect the power supply or remove the batteries and do not touch anything until it cools down!** When everything is safe and cool, review the product tutorial to identify the cause.
- Only operate the product in accordance with the instructions and guidelines of this tutorial, otherwise parts may be damaged or you could be injured.
- Store the product in a cool dry place and avoid exposing the product to direct sunlight.
- After use, always turn the power OFF and remove or unplug the batteries before storing.

Any concerns?  support@freenove.com

About Freenove

Freenove provides open source electronic products and services worldwide.

Freenove is committed to assist customers in their education of robotics, programming and electronic circuits so that they may transform their creative ideas into prototypes and new and innovative products. To this end, our services include but are not limited to:

- Educational and Entertaining Project Kits for Robots, Smart Cars and Drones
- Educational Kits to Learn Robotic Software Systems for Arduino, Raspberry Pi and micro:bit
- Electronic Component Assortments, Electronic Modules and Specialized Tools
- **Product Development and Customization Services**

You can find more about Freenove and get our latest news and updates through our website:

<http://www.freenove.com>

Preface

ESP32 is a micro control unit with integrated Wi-Fi launched by Espressif, which features strong properties and integrates rich peripherals. It can be designed and studied as an ordinary Single Chip Microcontroller(SCM) chip, or connected to the Internet and used as an Internet of Things device.

ESP32 can be developed using the Arduino platform, which will definitely make it easier for people who have learned Arduino to master. Moreover, the code of ESP32 is completely open-source, so beginners can quickly learn how to develop and design IOT smart household products including smart curtains, fans, lamps and clocks.

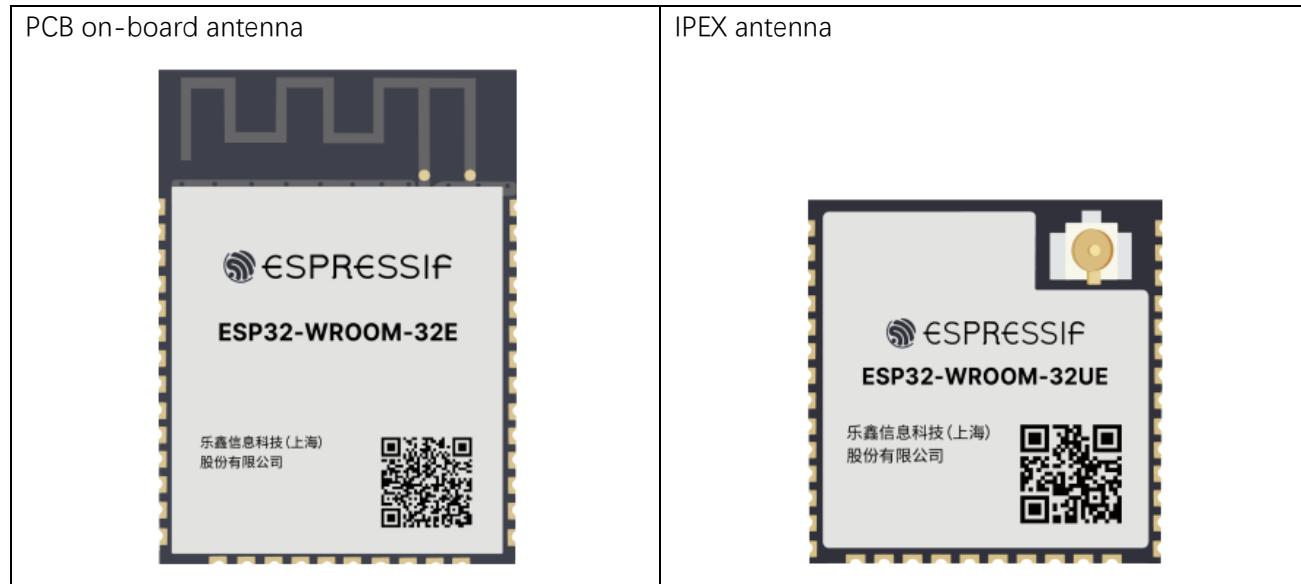

Generally, ESP32 projects consist of code and circuits. Don't worry even if you've never learned code and circuits, because we will gradually introduce the basic knowledge of C programming language and electronic circuits, from easy to difficult. Our products contain all the electronic components and modules needed to complete these projects. It's especially suitable for beginners.

We divide each project into four parts, namely Component List, Component Knowledge, Circuit and Code. Component List helps you to prepare material for the experiment more quickly. Component Knowledge allows you to quickly understand new electronic modules or components, while Circuit helps you understand the operating principle of the circuit. And Code allows you to easily master the use of SEP32 and accessory kit. After finishing all the projects in this tutorial, you can also use these components and modules to make products such as smart household, smart cars and robots to transform your creative ideas into prototypes and new and innovative products.

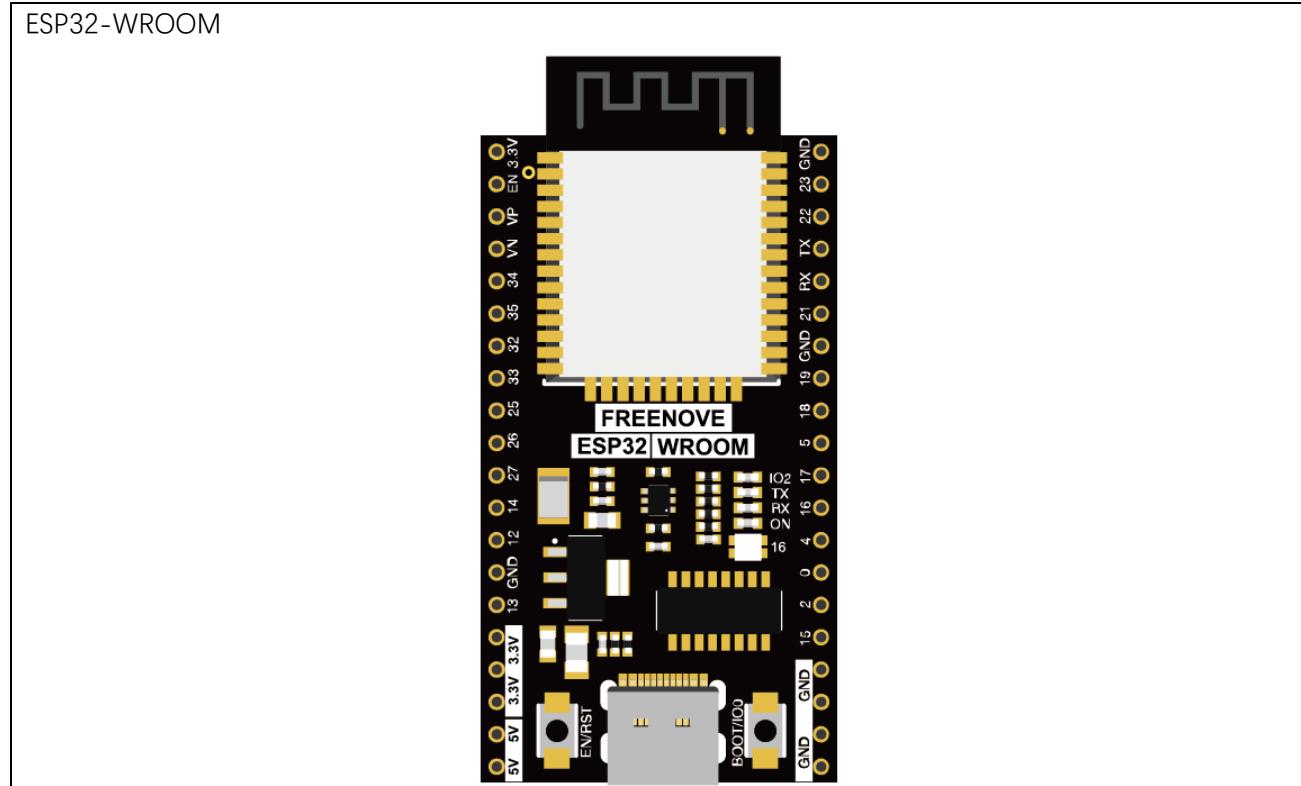

In addition, if you have any difficulties or questions with this tutorial or toolkit, feel free to ask for our quick and free technical support through support@freenove.com

ESP32-WROOM

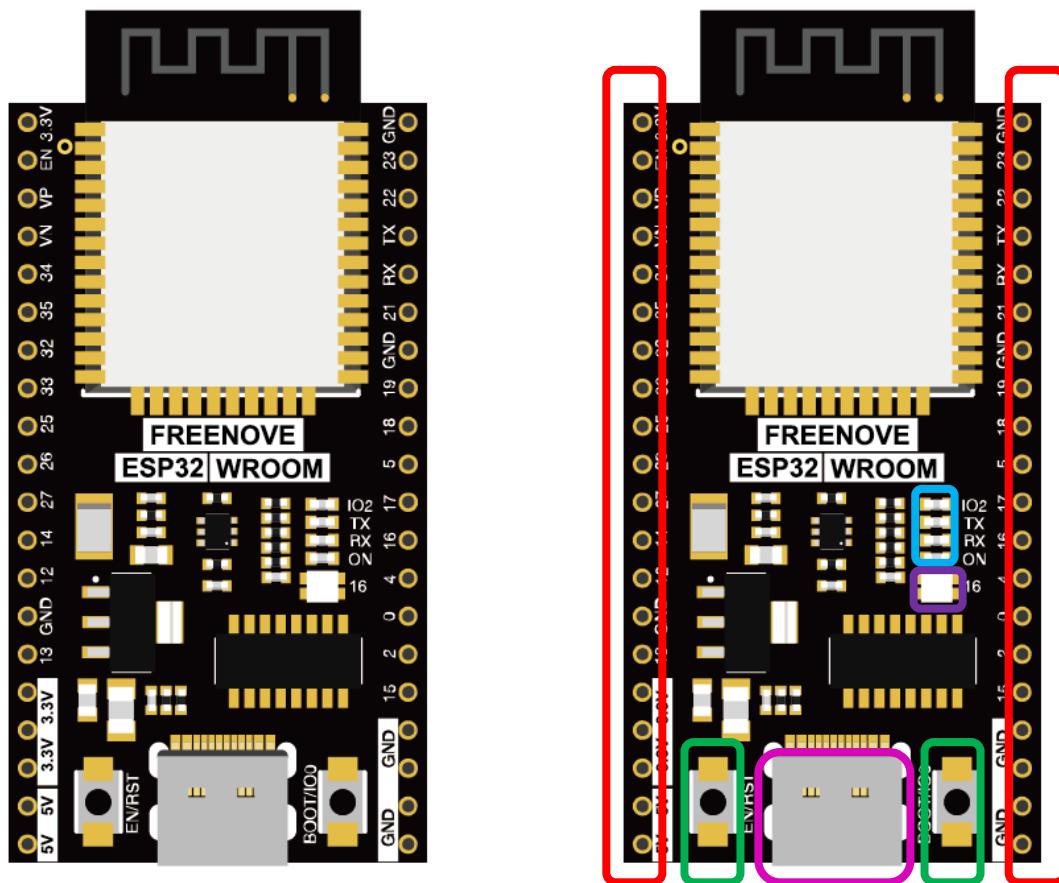

ESP32-WROOM has launched a total of two antenna packages, PCB on-board antenna and IPEX antenna respectively. The PCB on-board antenna is an integrated antenna in the chip module itself, so it is convenient to carry and design. The IPEX antenna is a metal antenna derived from the integrated antenna of the chip module itself, which is used to enhance the signal of the module.

In this tutorial, the ESP32-WROOM is designed based on the PCB on-board antenna-packaged ESP32-WROOM-32E module.

The hardware interfaces of ESP32-WROOM are distributed as follows:

Compare the left and right images. We've boxed off the resources on the ESP32-WROOM in different colors to facilitate your understanding of the ESP32-WROOM.

Box color	Corresponding resources introduction
	GPIO pin
	LED indicator
	WS2812
	Reset button, Boot mode selection button
	Type C port

For more information, please visit: https://www.espressif.com/sites/default/files/documentation/esp32-wroom-32e_esp32-wroom-32ue_datasheet_en.pdf

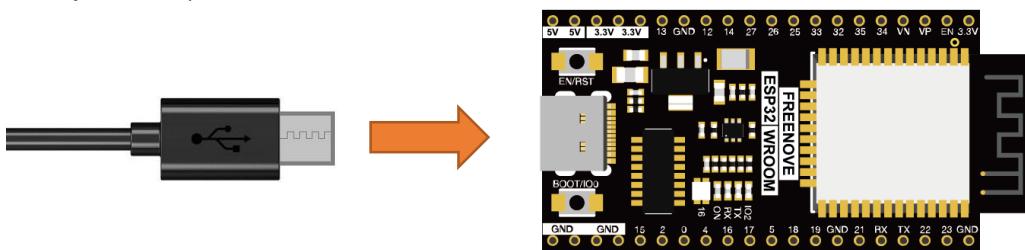

CH340 (Importance)

ESP32 uses CH340 to download codes. So before using it, we need to install CH340 driver in our computers.

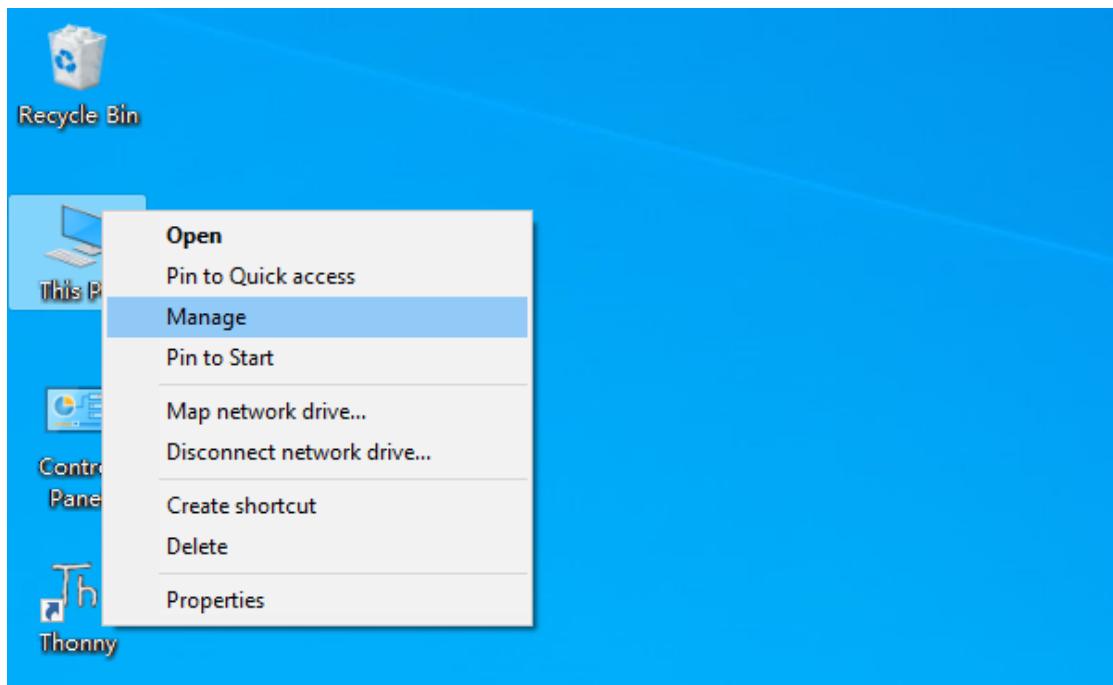

Windows

Check whether CH340 has been installed

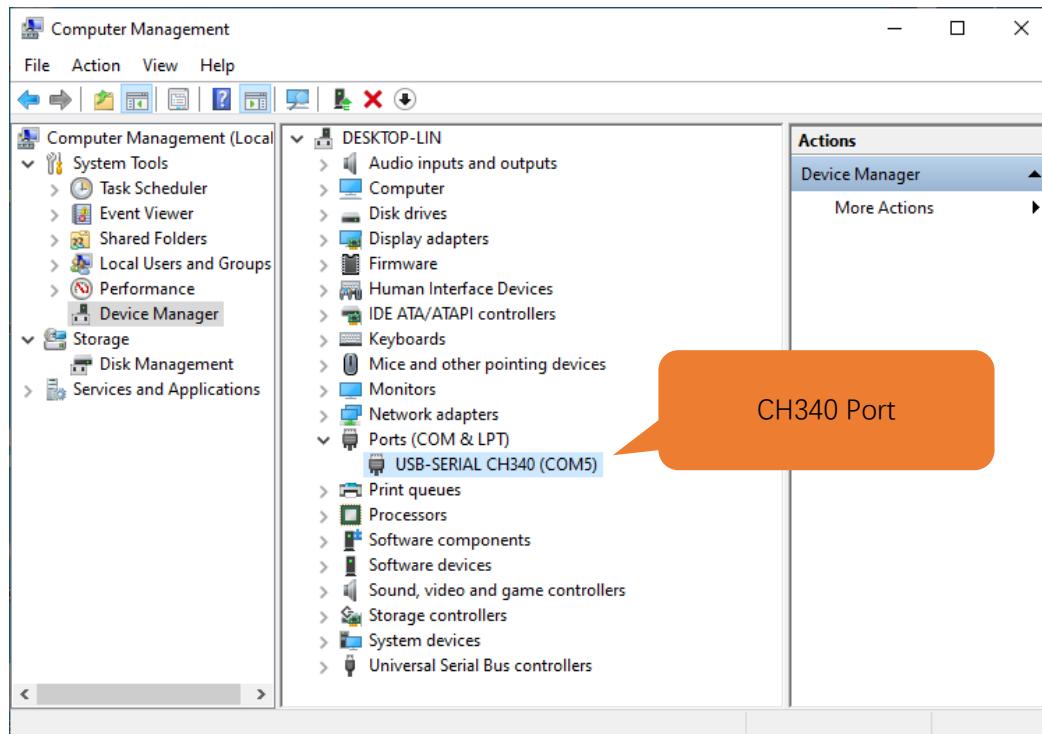

1. Connect your computer and ESP32 with a USB cable.

2. Turn to the main interface of your computer, select "This PC" and right-click to select "Manage".

3. Click “Device Manager”. If your computer has installed CH340, you can see “USB-SERIAL CH340 (COMx)”. And you can click [here](#) to move to the next step.

Installing CH340

1. First, download CH340 driver, click <http://www.wch-ic.com/search?q=CH340&t=downloads> to download the appropriate one based on your operating system.

index / search / search CH340

	InstallNoteOn64... Instructions for the driver after 18 years of August cannot be installed under some 64-bit WIN7 (English)	1.0	2019-01-10

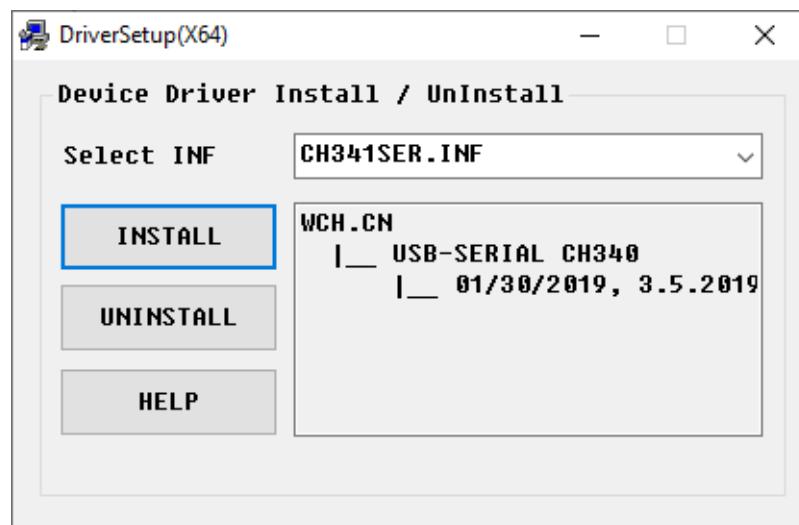

If you would not like to download the installation package, you can open “**Freenove_ESP32_WROOM_Board/CH340**”, we have prepared the installation package.

Name	Date modified	Type	Size
Linux	8/14/2020 5:24 PM	File folder	
MAC	8/14/2020 5:23 PM	File folder	
Windows	8/14/2020 5:23 PM	File folder	

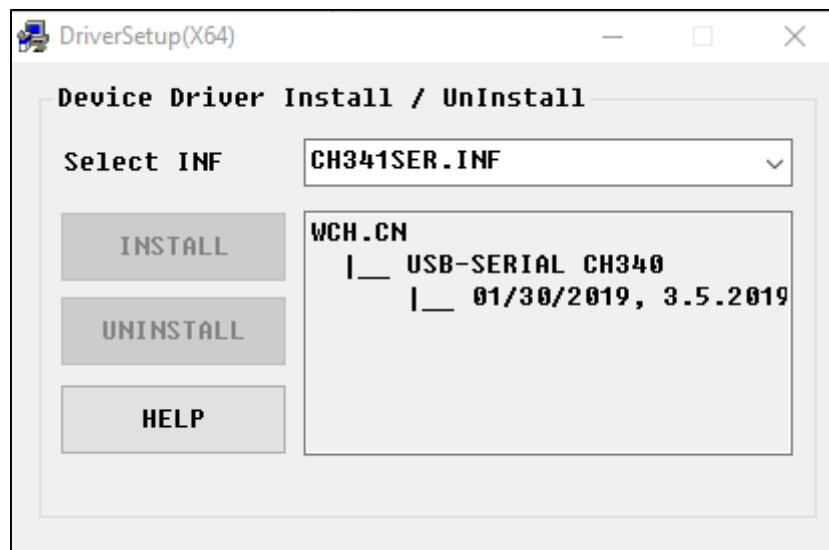

2. Open the folder “Freenove_ESP32_WROOM_Board/CH340/Windows/”

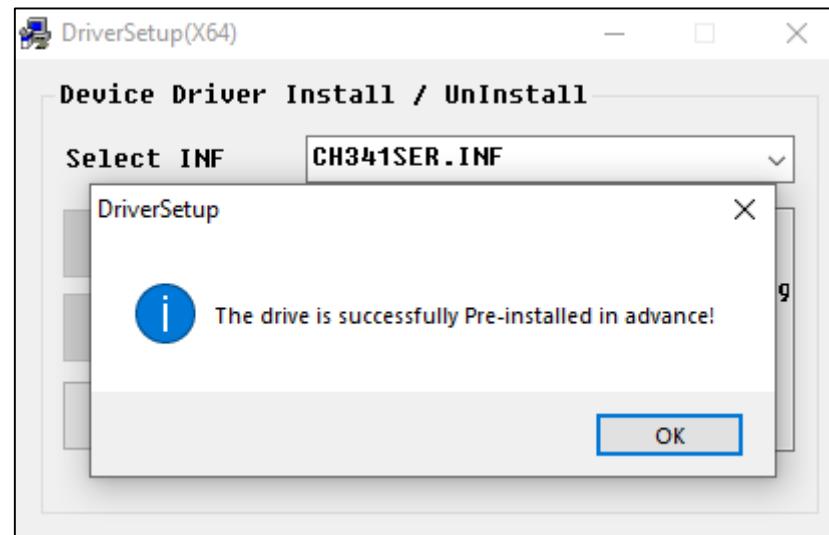

3. Double click “CH341SER.EXE”.

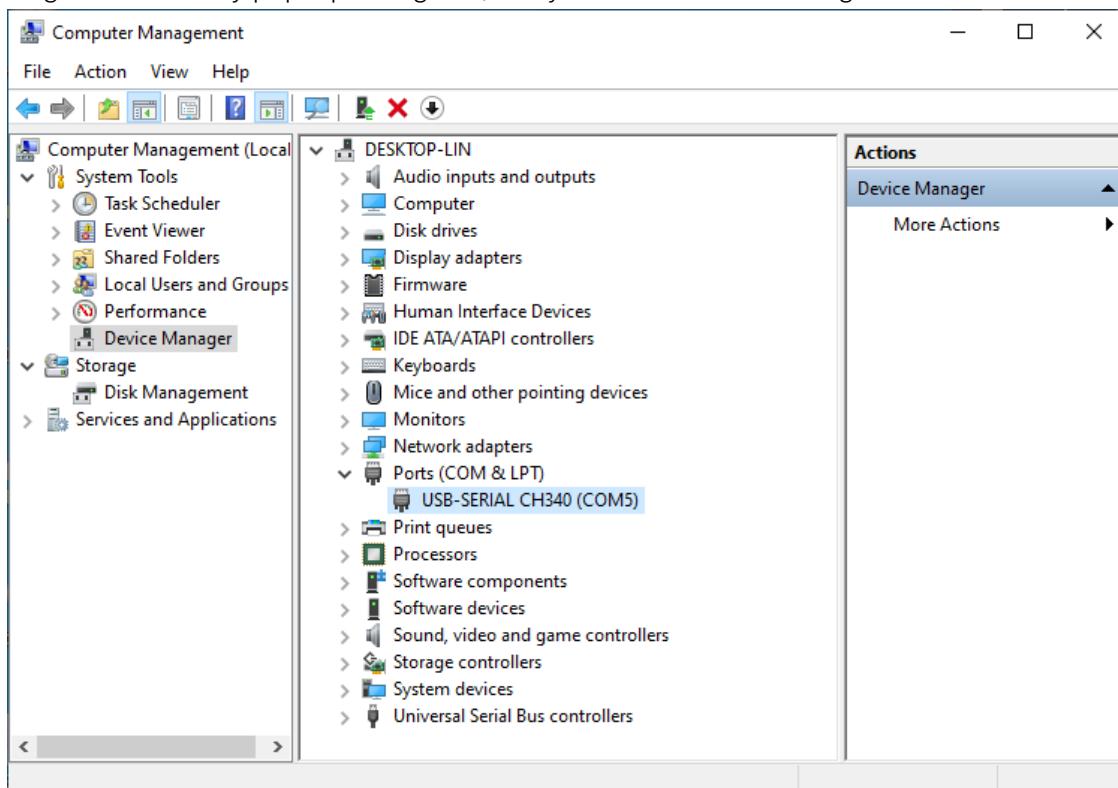

4. Click “INSTALL” and wait for the installation to complete.

5. Install successfully. Close all interfaces.

6. When ESP32 is connected to computer, select "This PC", right-click to select "Manage" and click "Device Manager" in the newly pop-up dialog box, and you can see the following interface.

7. So far, CH340 has been installed successfully. Close all dialog boxes.

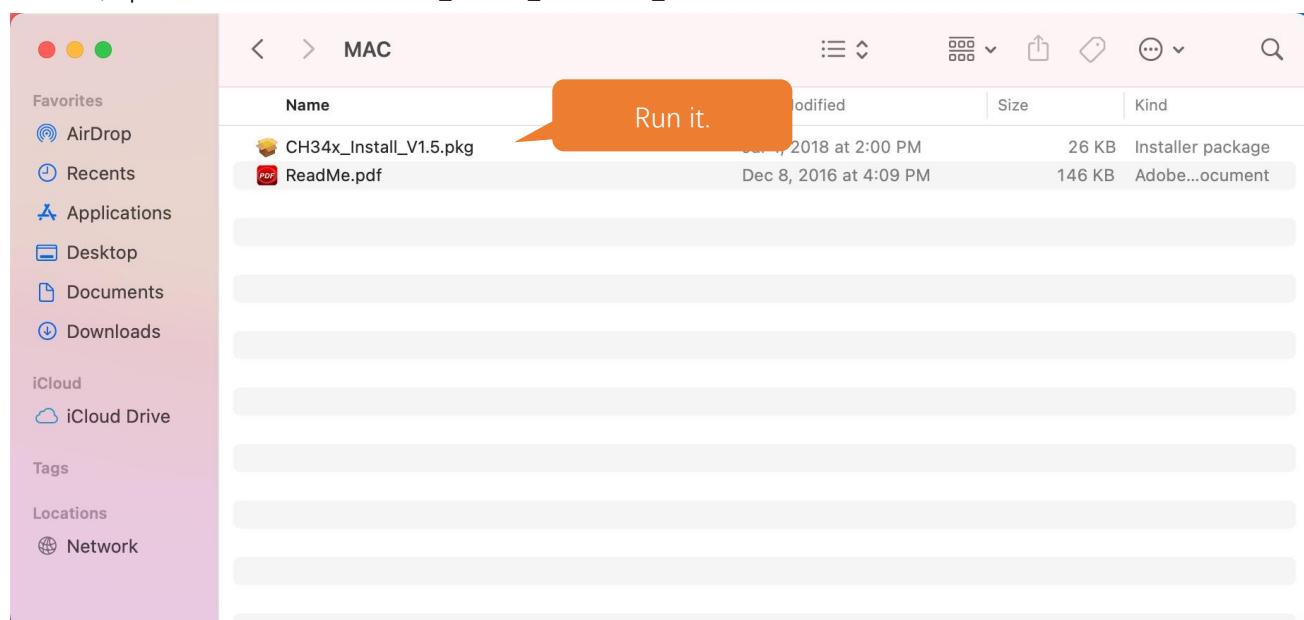

MAC

First, download CH340 driver, click <http://www.wch-ic.com/search?q=CH340&t=downloads> to download the appropriate one based on your operating system.

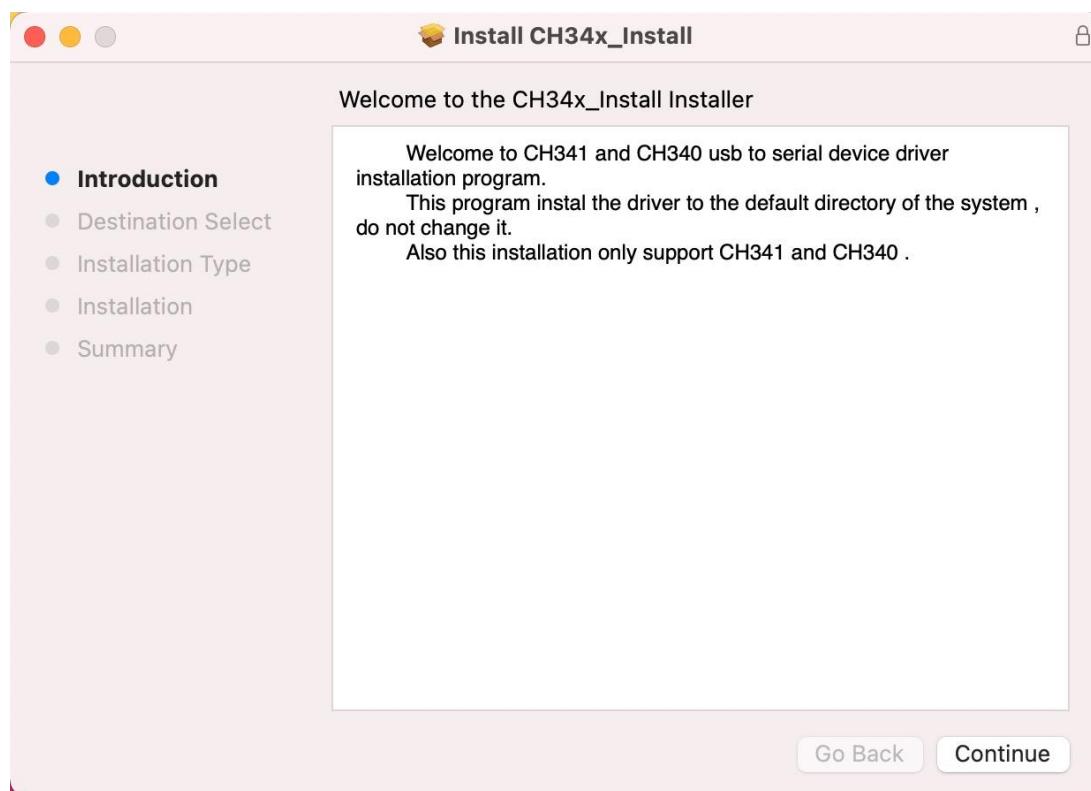

The screenshot shows a search results page for 'ch340' on the WCH website. The left sidebar has categories: All (14), Downloads (7), Products (4), Application (2), Video (1), and News (0). The main area shows search results for 'Downloads(7)'. There are three orange callout boxes pointing to specific files: 'Windows' points to 'CH341SER.EXE' (Windows 10/8.1/8/7/VISTA/XP, Server 2016/2012/2008/2003, 2000/ME/98); 'Linux' points to 'CH341SER_LINUX...' (CH340/CH341 USB to serial port LINUX driver); and 'MAC' points to 'CH341SER_MAC.ZIP' (CH340/CH341 USB to serial port MAC OS driver).

file category	file content	version	upload time
Driver&Tools	CH341SER.EXE	3.5	2019-03-18
	CH341SER.ZIP	3.5	2019-03-05
	CH341SER_ANDROID...	1.6	2019-04-19
	CH341SER_LINUX...	1.5	2018-03-18
	CH341SER_MAC.ZI...	1.5	2018-07-05
Others			

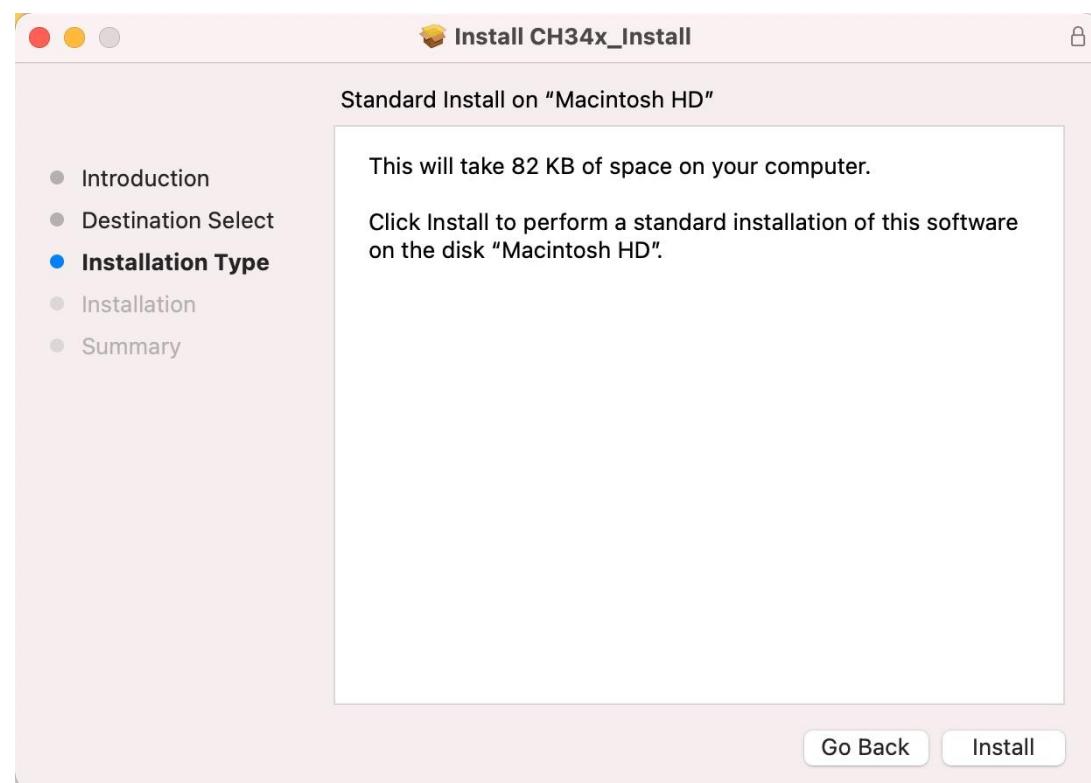

If you would not like to download the installation package, you can open "Freenove_ESP32_WROOM_Board/CH340", we have prepared the installation package. Second, open the folder "Freenove_ESP32_WROOM_Board/CH340/MAC/"

Third, click Continue.

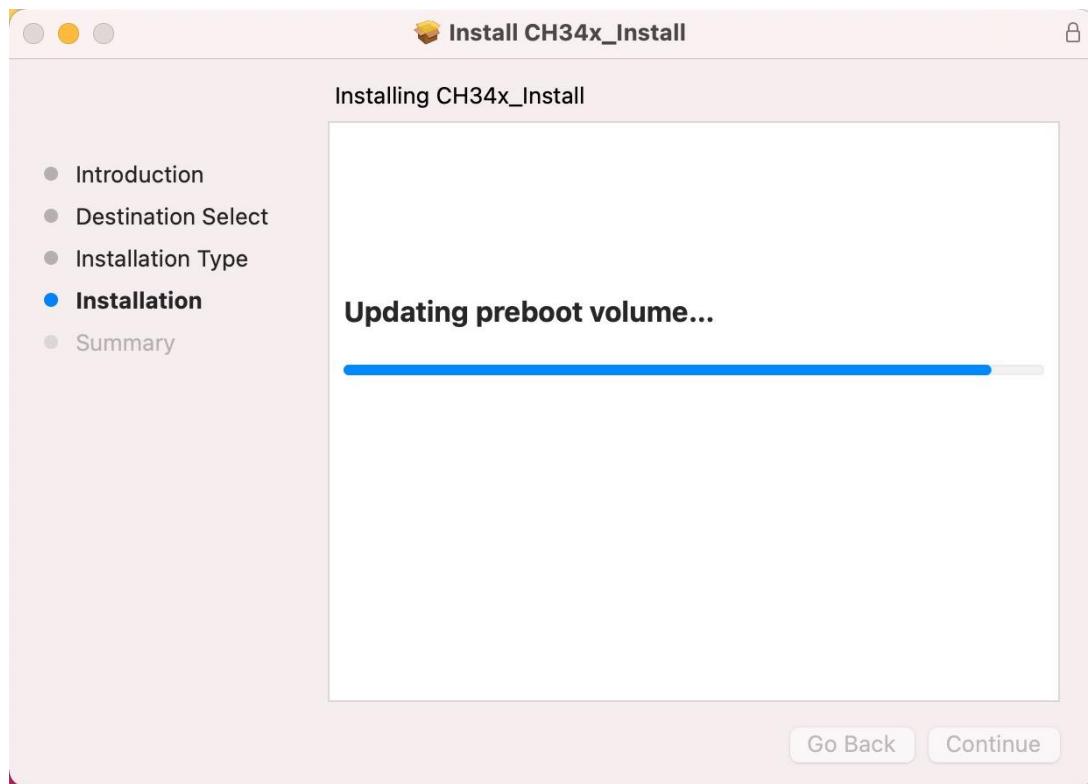

Fourth, click Install.

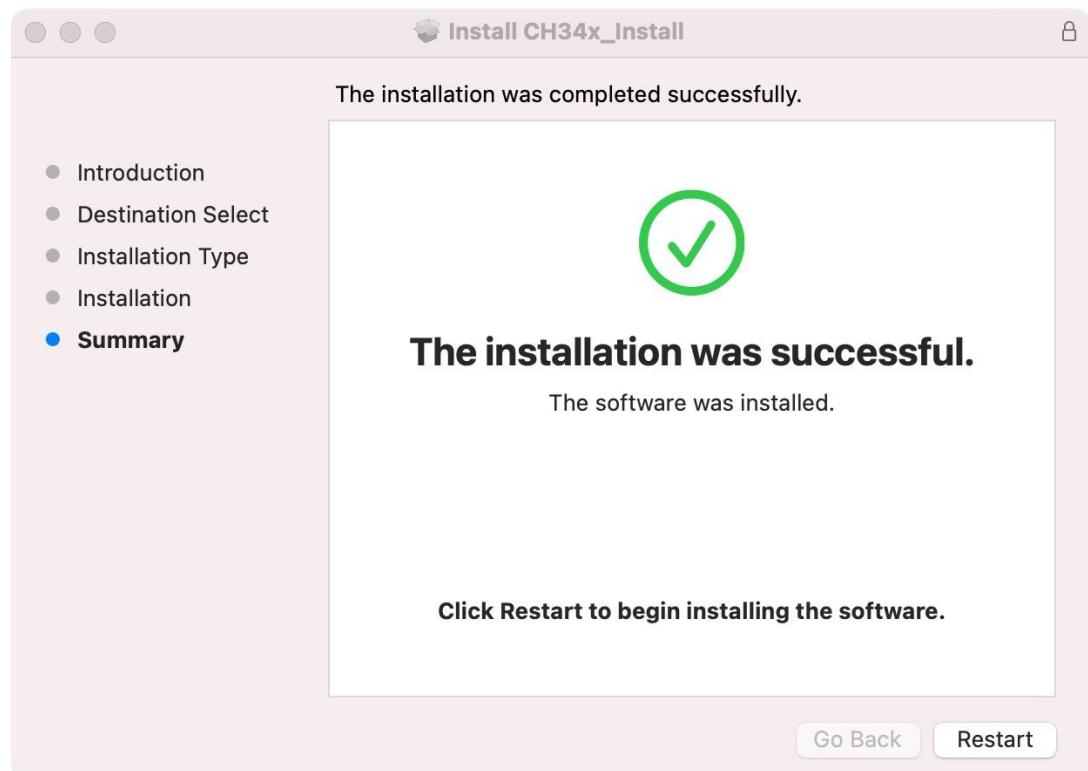

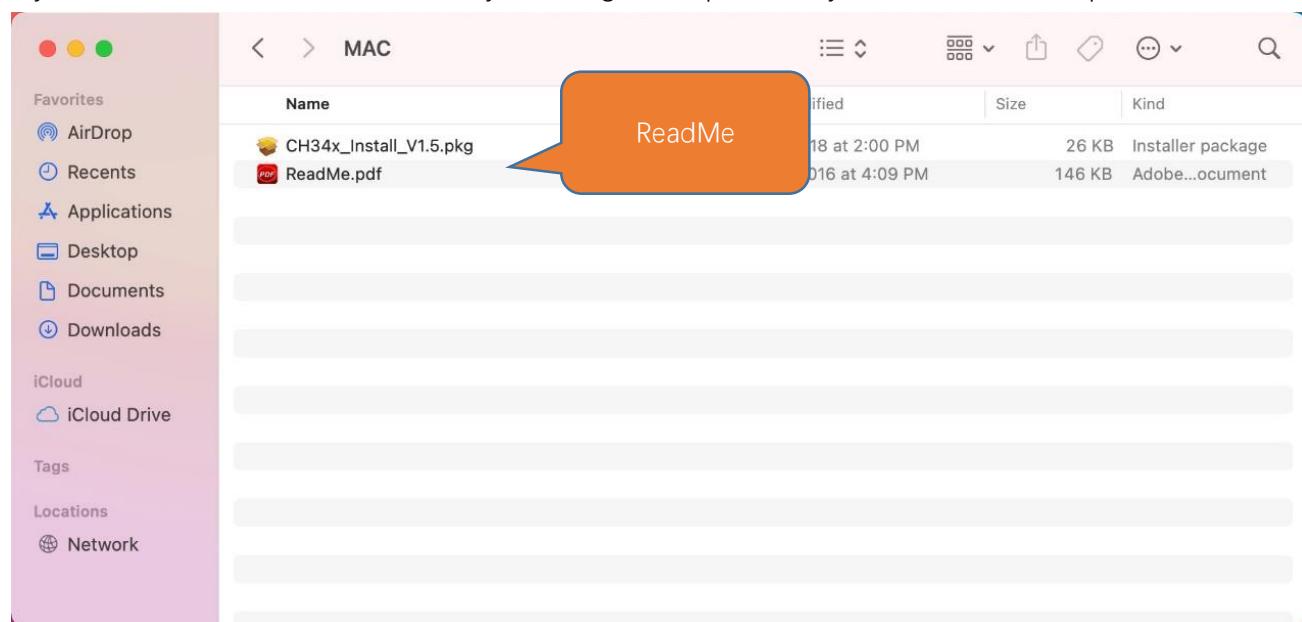

Then, waiting Finsh.

Finally, restart your PC.

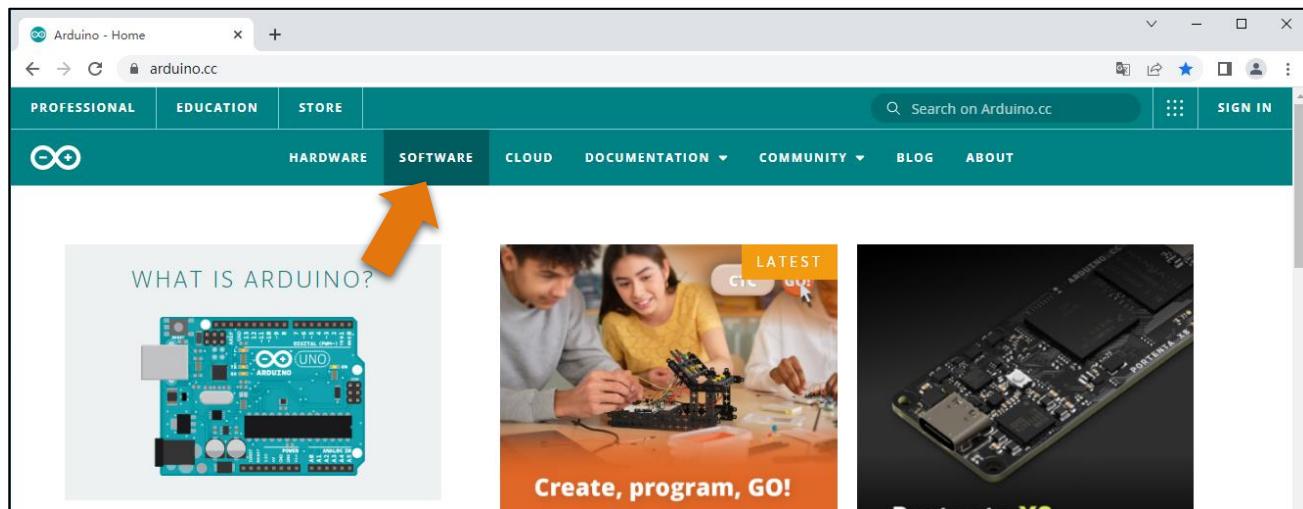

If you still haven't installed the CH340 by following the steps above, you can view `readme.pdf` to install it.

Programming Software

Arduino Software (IDE) is used to write and upload the code for Arduino Board.

First, install Arduino Software (IDE): visit <https://www.arduino.cc>, click "Download" to enter the download page.

Select and download corresponding installer according to your operating system. If you are a windows user, please select the "Windows" to download and install it correctly.

Platform	Version	Notes
Windows	Win 10 and newer, 64 bits	
Windows	MSI installer	
Windows	ZIP file	
Linux	AppImage 64 bits (X86-64)	
Linux	ZIP file 64 bits (X86-64)	
macOS	Intel, 10.14: "Mojave" or newer, 64 bits	
macOS	Apple Silicon, 11: "Big Sur" or newer, 64 bits	

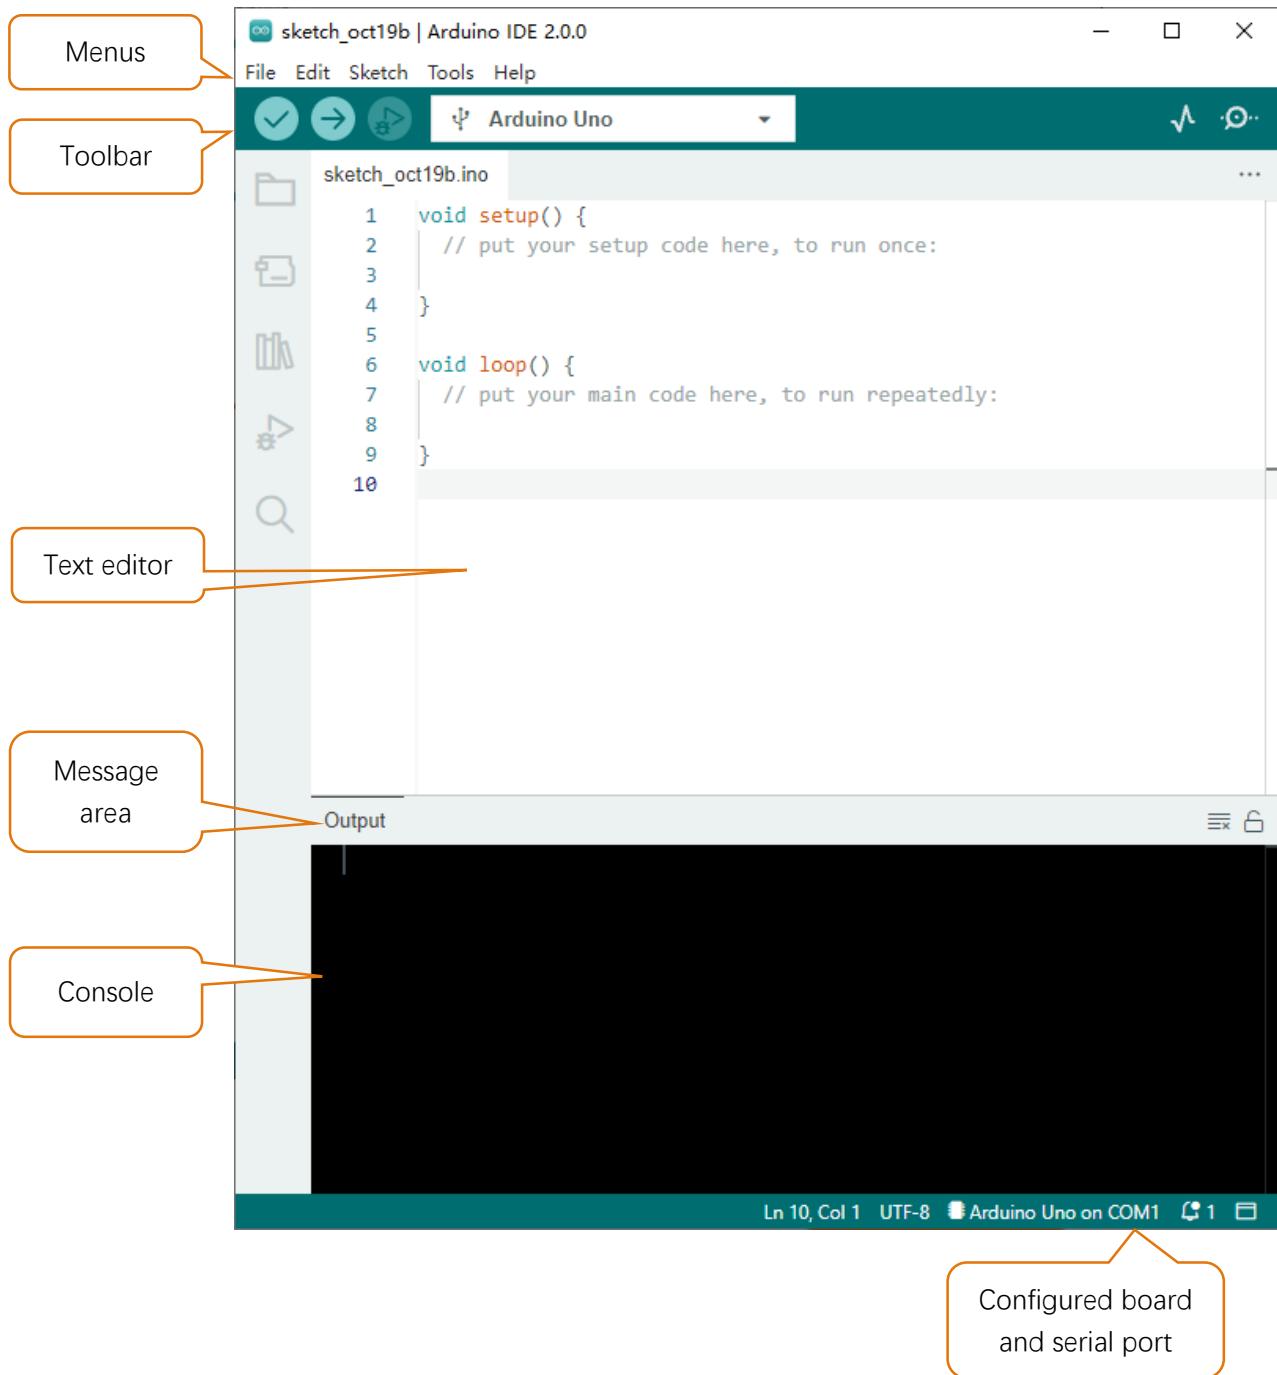

After the download completes, run the installer. For Windows users, there may pop up an installation dialog box of driver during the installation process. When it popes up, please allow the installation.

After installation completes, an Arduino Software shortcut will be generated in the desktop. Run the Arduino Software.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

The interface of Arduino Software is as follows:

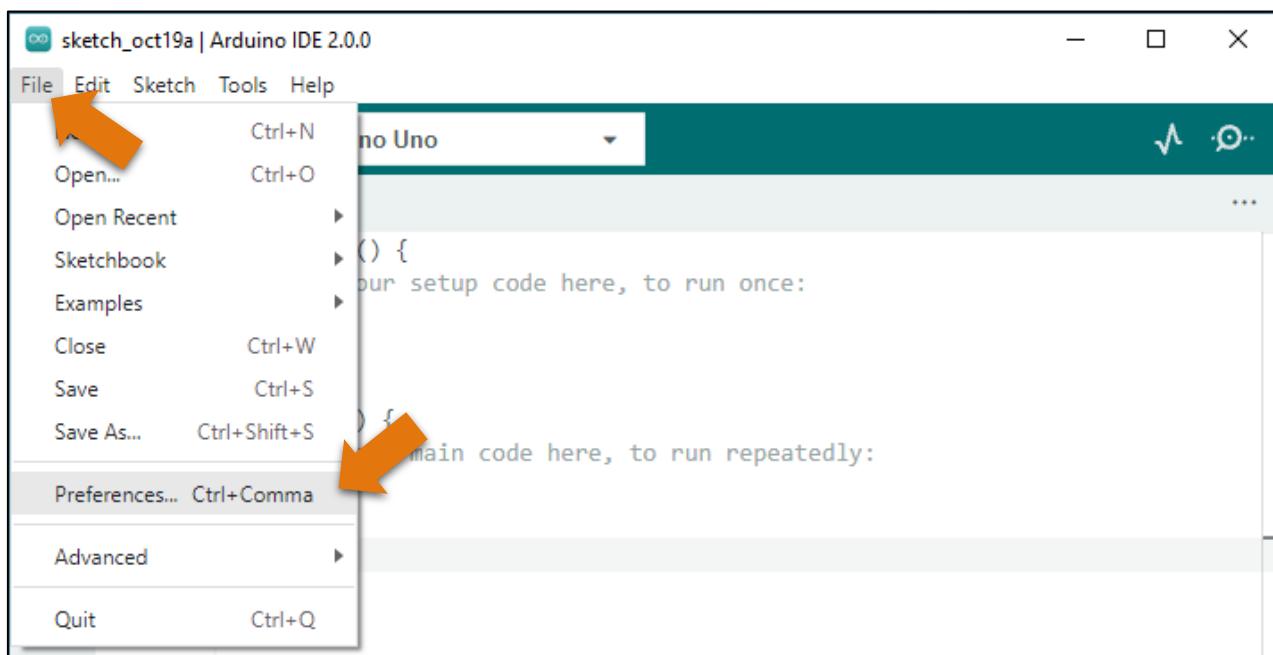

Programs written with Arduino Software (IDE) are called **sketches**. These sketches are written in the text editor and saved with the file extension **.ino**. The editor features text cutting/pasting and searching/replacing. The message area gives feedback while saving and exporting and also displays errors. The console displays text output by the Arduino Software (IDE), including complete error messages and other information. The bottom right-hand corner of the window displays the configured board and serial port. The toolbar buttons allow you to verify and upload programs, create, open, and save sketches, and open the serial monitor.

	Verify Check your code for compile errors.
	Upload Compile your code and upload them to the configured board.
	Debug Debug code running on the board. (Some development boards do not support this function)
Arduino Uno	Development board selection Configure the support package and upload port of the development board.
	Serial Plotter Receive serial port data and plot it in a discounted graph.
	Serial Monitor Open the serial monitor.

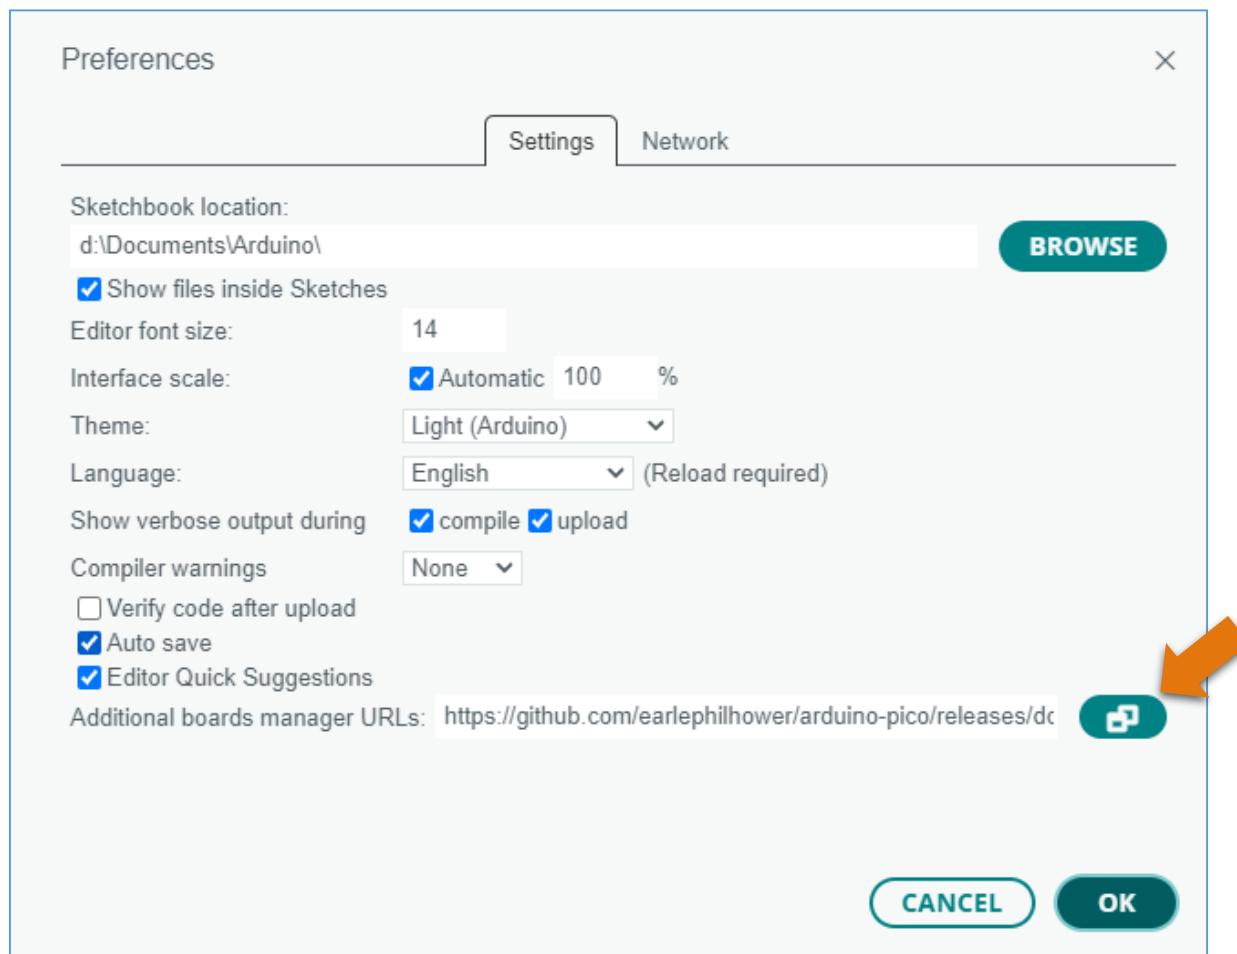

Additional commands are found within the five menus: File, Edit, Sketch, Tools, Help. The menus are context sensitive, which means only those items relevant to the work currently being carried out are available.

Environment Configuration

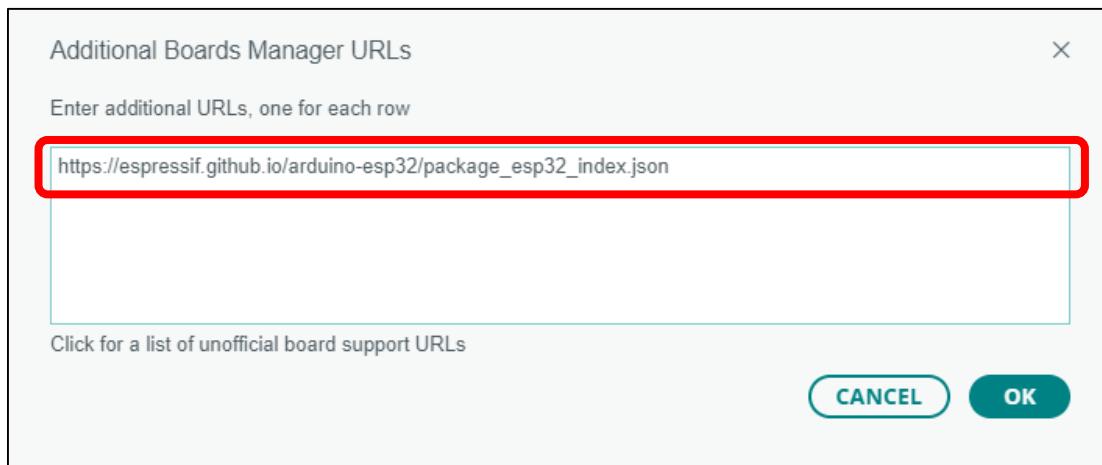

First, open the software platform arduino, and then click File in Menus and select Preferences.

Second, click on the symbol behind "Additional Boards Manager URLs"

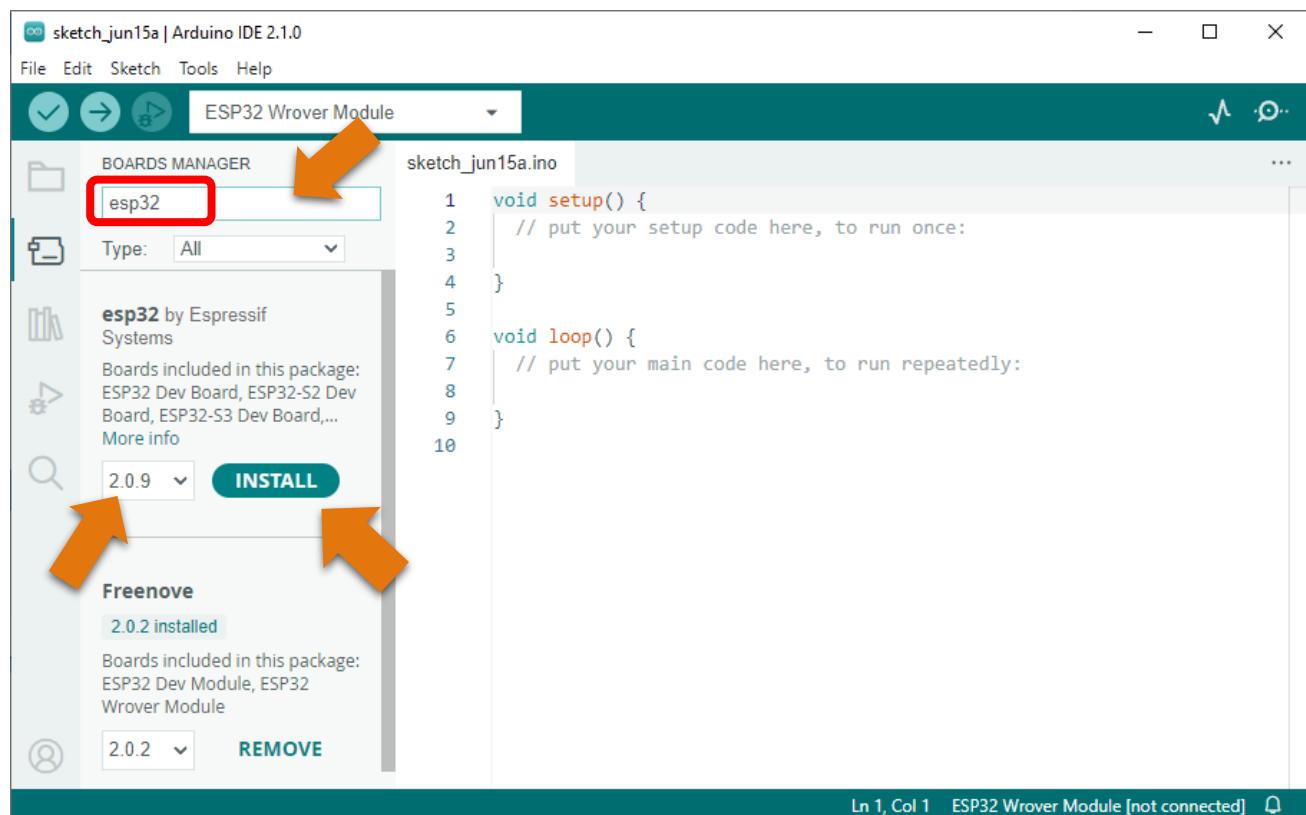

Third, fill in https://espressif.github.io/arduino-esp32/package_esp32_index.json in the new window, click OK, and click OK on the Preferences window again.

Note: if you copy and paste the URL directly, you may lose the "-". Please check carefully to make sure the link is correct.

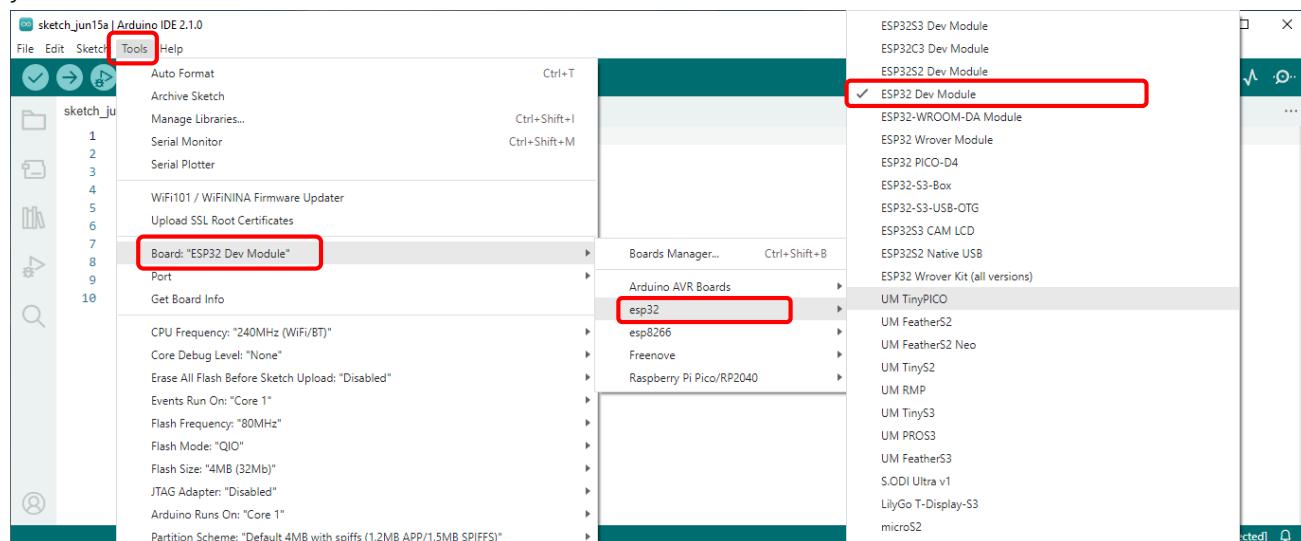

Fourth, click "Boards Manager". Enter "esp32" in Boards manager, select 2.0.9, and click "INSTALL".

Arduino will download these files automatically. Wait for the installation to complete.

When finishing installation, click Tools in the Menus again and select Board: "ESP32 Dev Module", and then you can see information of ESP32.

Keep the default Settings.

Notes for GPIO

Strapping Pin

There are five Strapping pins for ESP32: MTDI、GPIO0、GPIO2、MTDO、GPIO5.

With the release of the chip's system reset (power-on reset, RTC watchdog reset, undervoltage reset), the strapping pins sample the level and store it in the latch as "0" or "1", and keep it until the chip is powered off or turned off.

Each Strapping pin is connecting to internal pull-up/pull-down. Connecting to high-impedance external circuit or without an external connection, a strapping pin's default value of input level will be determined by internal weak pull-up/pull-down. To change the value of the Strapping, users can apply an external pull-down/pull-up resistor, or use the GPIO of the host MCU to control the level of the strapping pin when the ESP32's power on reset is released.

When releasing the reset, the strapping pin has the same function as a normal pin.

The followings are default configurations of these five strapping pins at power-on and their functions under the corresponding configuration.

Voltage of Internal LDO (VDD_SDIO)					
Pin	Default	3.3 V	1.8 V		
MTDI	Pull-down	0	1		
Booting Mode					
Pin	Default	SPI Boot	Download Boot		
GPIO0	Pull-up	1	0		
GPIO2	Pull-down	Don't-care	0		
Enabling/Disabling Debugging Log Print over U0TXD During Booting					
Pin	Default	U0TXD Active	U0TXD Silent		
MTDO	Pull-up	1	0		
Timing of SDIO Slave					
Pin	Default	Falling-edge Sampling Falling-edge Output	Falling-edge Sampling Rising-edge Output	Rising-edge Sampling Falling-edge Output	Rising-edge Sampling Rising-edge Output
MTDO	Pull-up	0	0	1	1
GPIO5	Pull-up	0	1	0	1

Note:

- Firmware can configure register bits to change the settings of "Voltage of Internal LDO (VDD_SDIO)" and "Timing of SDIO Slave" after booting.
- The MTDI is internally pulled high in the module, as the flash and SRAM in ESP32-WROVER only support a power voltage of 1.8 V (output by VDD_SDIO).

If you have any difficulties or questions with this tutorial or toolkit, feel free to ask for our quick and free technical support through support@freenove.com at any time.

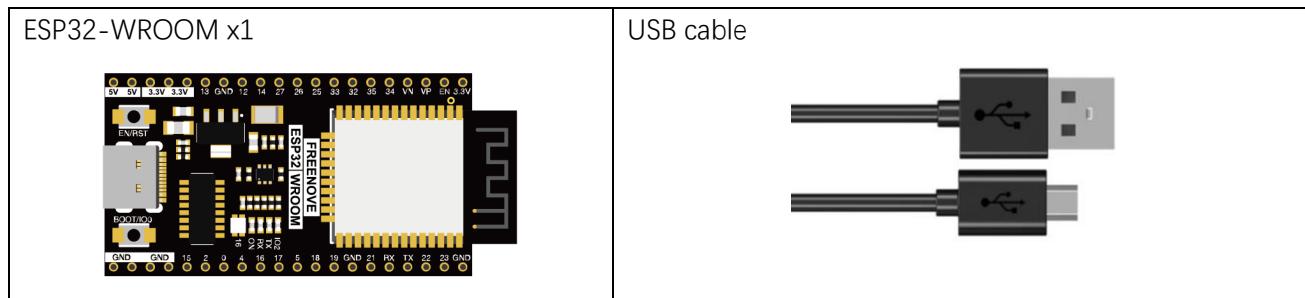

Chapter 1 LED

This chapter is the Start Point in the journey to build and explore ESP32 electronic projects. We will start with simple “Blink” project.

Project 1.1 Blink

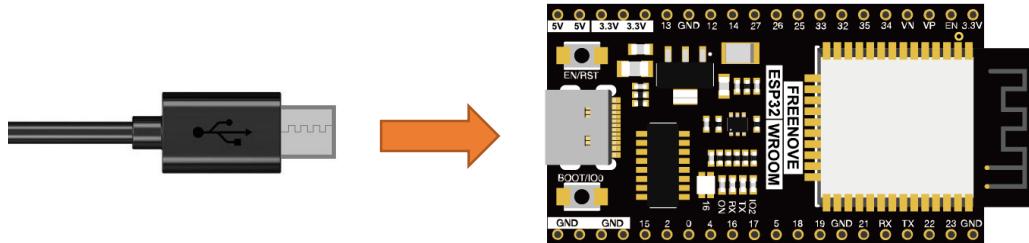

In this project, we will use ESP32 to control blinking a common LED.

Component List

Power

ESP32-WROOM needs 5v power supply. In this tutorial, we need connect ESP32-WROOM to computer via USB cable to power it and program it. We can also use other 5v power source to power it.

In the following projects, we only use USB cable to power ESP32-WROOM by default.

Sketch

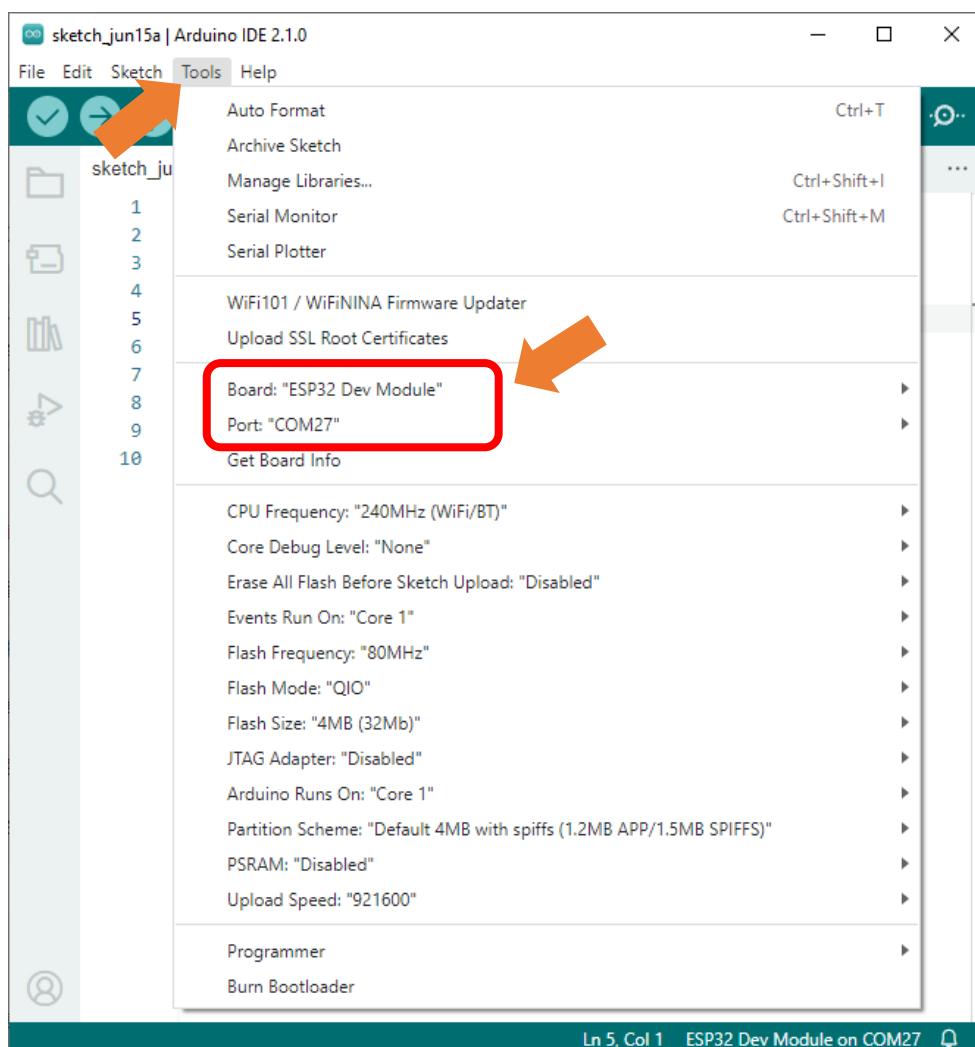

According to the circuit, when the GPIO2 of ESP32-WROOM output level is high, the LED turns ON. Conversely, when the GPIO2 ESP32-WROOM output level is low, the LED turns OFF. Therefore, we can let GPIO2 circularly output high and low level to make the LED blink.

Upload the following Sketch: s

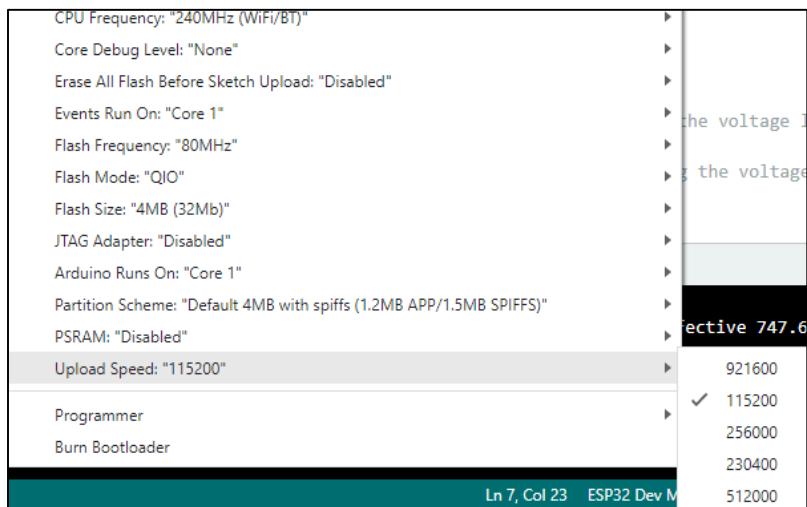

Freenove_ESP32_WROOM_Board\Sketches\Sketch_01.1_Blink.

Before uploading the code, click "**Tools**", "**Board**" and select "**ESP32 Dev Module**".

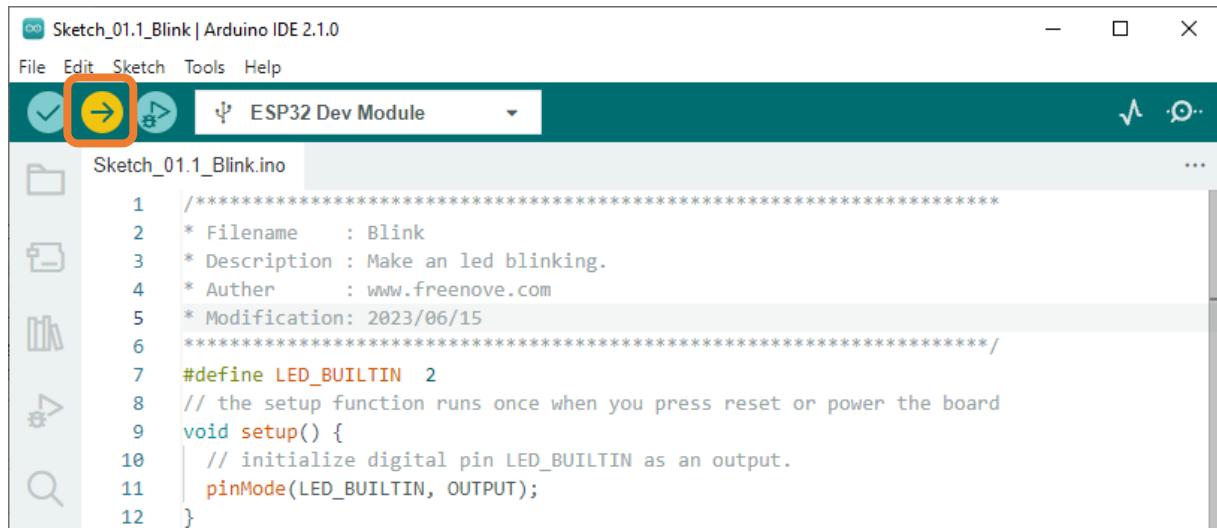

Select the serial port.

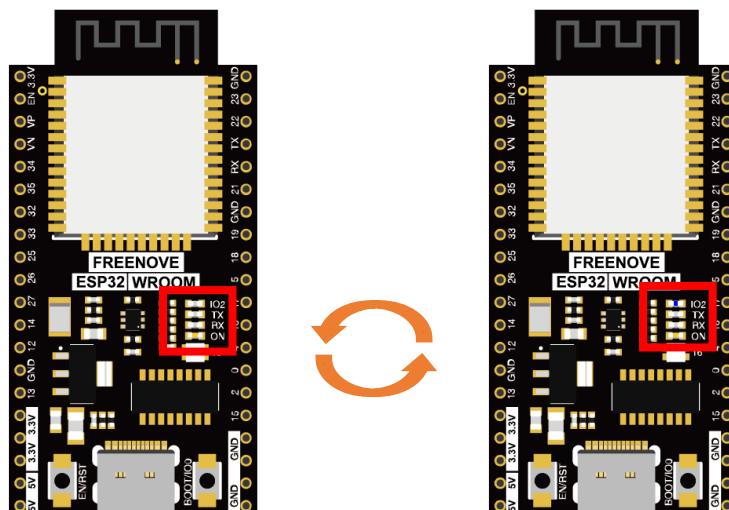

Note: For macOS users, if the uploading fails, please set the baud rate to 115200 before clicking “Upload Using Programmer”.

Sketch_01.1_Blink

Click “Upload”, Download the code to ESP32-WROOM and your LED in the circuit starts Blink.

If you have any concerns, please contact us via: support@freenove.com

Any concerns? ✉ support@freenove.com

The following is the program code:

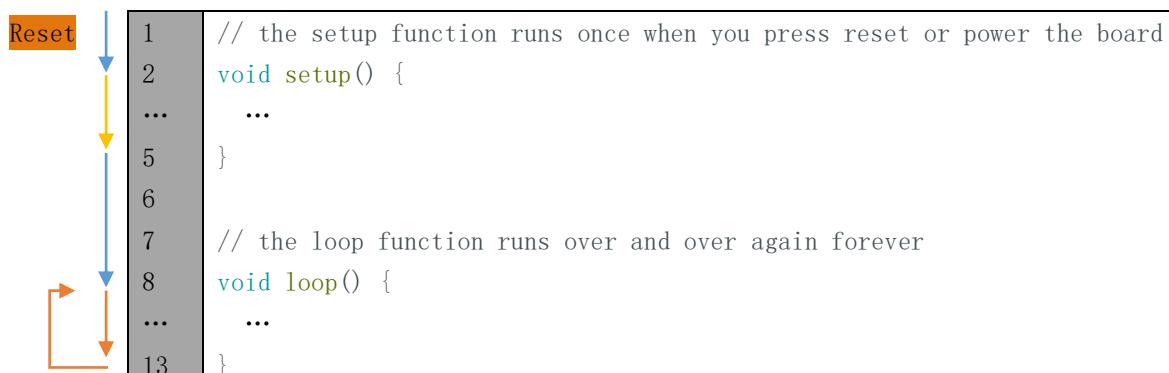

```

1 #define PIN_LED 2
2 // the setup function runs once when you press reset or power the board
3 void setup() {
4     // initialize digital pin LED_BUILTIN as an output.
5     pinMode(PIN_LED, OUTPUT);
6 }
7
8 // the loop function runs over and over again forever
9 void loop() {
10    digitalWrite(PIN_LED, HIGH); // turn the LED on (HIGH is the voltage level)
11    delay(1000); // wait for a second
12    digitalWrite(PIN_LED, LOW); // turn the LED off by making the voltage LOW
13    delay(1000); // wait for a second
14 }
```

The Arduino IDE code usually contains two basic functions: void setup() and void loop().

After the board is reset, the setup() function will be executed firstly, and then the loop() function.

setup() function is generally used to write code to initialize the hardware. And loop() function is used to write code to achieve certain functions. loop() function is executed repeatedly. When the execution reaches the end of loop(), it will jump to the beginning of loop() to run again.

Reset

Reset operation will lead the code to be executed from the beginning. Switching on the power, finishing uploading the code and pressing the reset button will trigger reset operation.

In the circuit, ESP32-WROOM's GPIO2 is connected to the LED, so the LED pin is defined as 2.

```
1 #define PIN_LED 2
```

This means that after this line of code, all PIN_LED will be treated as 2.

In the setup () function, first, we set the PIN_LED as output mode, which can make the port output high level or low level.

```

4 // initialize digital pin PIN_LED as an output.
5 pinMode(PIN_LED, OUTPUT);
```

Then, in the loop () function, set the PIN_LED to output high level to make LED light up.

```
10 digitalWrite(PIN_LED, HIGH); // turn the LED on (HIGH is the voltage level)
```

Any concerns? ✉ support@freenove.com

Wait for 1000ms, that is 1s. Delay () function is used to make control board wait for a moment before executing the next statement. The parameter indicates the number of milliseconds to wait for.

```
11 delay(1000); // wait for a second
```

Then set the PIN_LED to output low level, and LED light off. One second later, the execution of loop () function will be completed.

```
12 digitalWrite(PIN_LED, LOW); // turn the LED off by making the voltage LOW  
13 delay(1000); // wait for a second
```

The loop() function is constantly being executed, so LED will keep blinking.

Reference

```
void pinMode(int pin, int mode);
```

Configures the specified pin to behave either as an input or an output.

Parameters

pin: the pin number to set the mode of.

mode: INPUT, OUTPUT, INPUT_PULLDOWN, or INPUT_PULLUP.

```
void digitalWrite (int pin, int value);
```

Writes the value HIGH or LOW (1 or 0) to the given pin which must have been previously set as an output.

For more related functions, please refer to <https://www.arduino.cc/reference/en/>

Chapter 2 WS2812

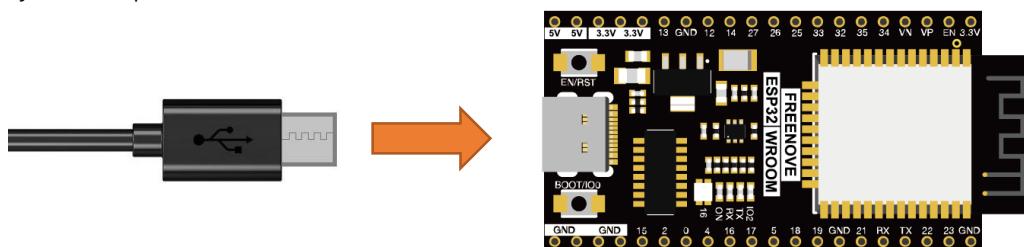

This chapter will help you learn to use a more convenient RGB LED lamp, which requires only one GPIO control and can be connected in infinite series in theory. Each LED can be controlled independently.

Project 2.1 WS2812

Learn the basic usage of ws2812 and use it to flash red, green, blue and white.

Circuit

Connect your computer and ESP32 with a USB cable.

Sketch

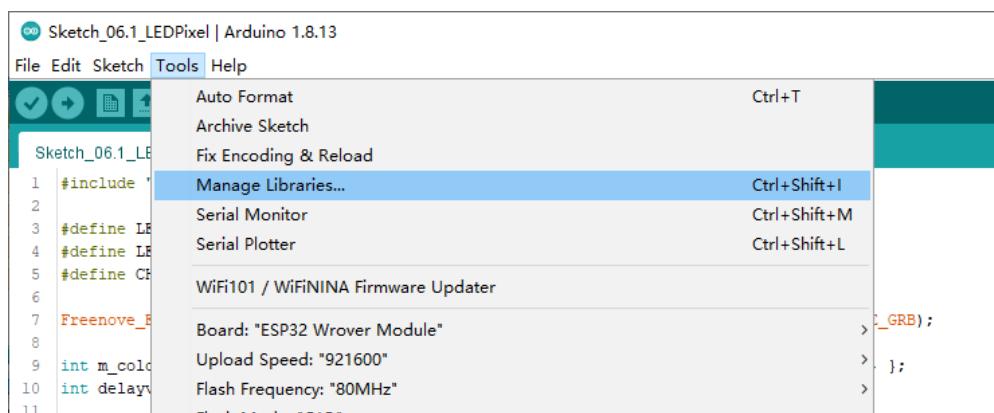

This code uses a library named "Freenove_WS2812_Lib_for_ESP32", if you have not installed it, please do so first.

Library is an important feature of the open source world, and we know that Arduino is an open source platform that everyone can contribute to. Libraries are generally licensed under the LGPL, which means you can use them for free to apply to your creations.

How to install the library

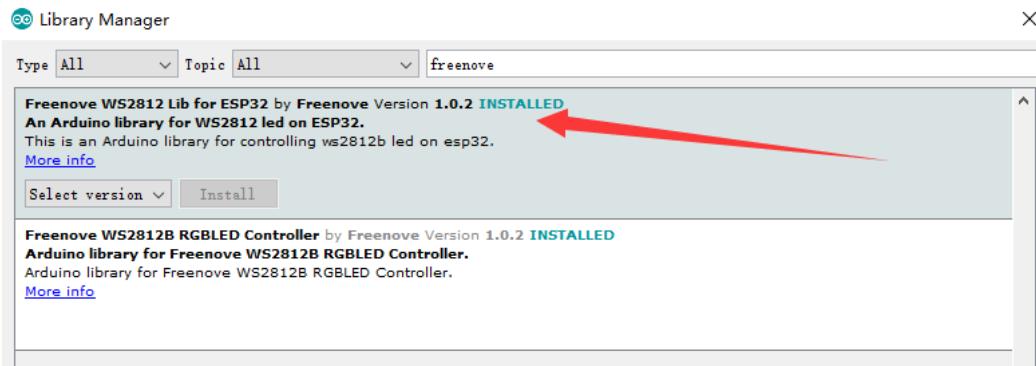

There are two ways to add libraries.

The first way, open the Arduino IDE, click Tools → Manager Libraries.

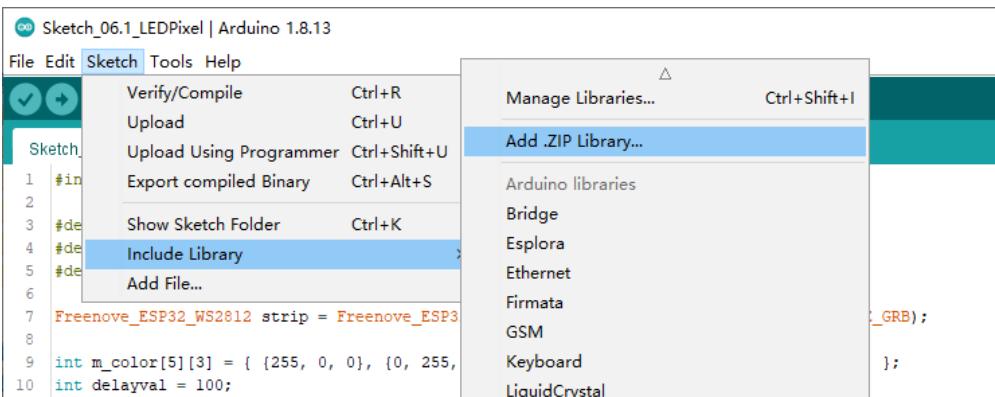

Any concerns? ✉ support@freenove.com

In the pop-up window, Library Manager, search for the name of the Library, “Freenove WS2812 Lib for ESP32”. Then click Install.

The second way, open Arduino IDE, click Sketch→Include Library→Add .ZIP Library, In the pop-up window, find the file named “./Libraries/Freenove_WS2812_Lib_for_ESP32.Zip” which locates in this directory, and click OPEN.

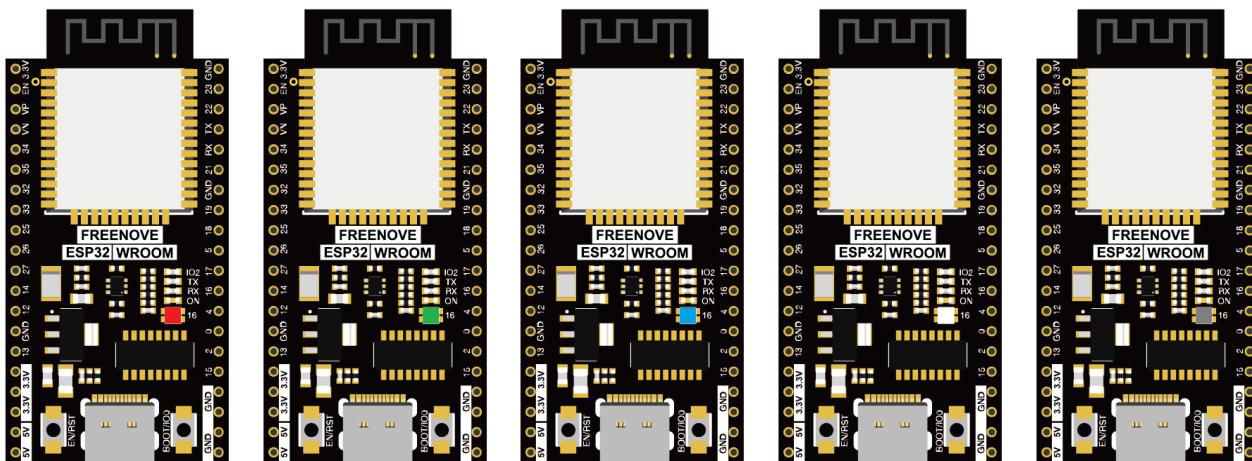

Sketch_02.1_WS2812

```

Sketch_02.1_WS2812 | Arduino IDE 2.1.0
File Edit Sketch Tools Help
ESP32 Dev Module
Sketch_02.1_WS2812.ino
8 #include "Freenove_WS2812_Lib_for_ESP32.h"
9
10 #define LEDS_COUNT 1 // The number of led
11 #define LEDS_PIN 16 // define the pin connected to the Freenove 8 led strip
12 #define CHANNEL 0 // RMT module channel
13
14 Freenove_ESP32_WS2812 strip = Freenove_ESP32_WS2812(LEDs_Count, LEDs_Pin, Channel, Type_GRB);
15
16 int m_color[5][3] = { {255, 0, 0}, {0, 255, 0}, {0, 0, 255}, {255, 255, 255}, {0, 0, 0} };
17 int delayval = 100;
18
19 void setup() {
20     strip.begin();
21     strip.setBrightness(10);
22 }
23 void loop() {
24     for (int j = 0; j < 5; j++) {
25         for (int i = 0; i < LEDS_COUNT; i++) {
26             strip.setLedColorData(i, m_color[j][0], m_color[j][1], m_color[j][2]); // Set color data.
27             strip.show(); // Send color data to LED, and display.
28             delay(delayval); // Interval time of each LED.
29         }
29         delay(500); // Interval time of each group of colors.
30     }
31 }
32 }

```

Download the code to ESP32-WROOM and RGB LED begins to light up in red, green, blue and black.

The following is the program code:

```

1 #include "Freenove_WS2812_Lib_for_ESP32.h"
2
3 #define LEDS_COUNT 1 // The number of led
4 #define LEDS_PIN    16 // define the pin connected to the led strip
5 #define CHANNEL     0 // RMT channel
6
7 Freenove_ESP32_WS2812 strip = Freenove_ESP32_WS2812(LEDS_COUNT, LEDS_PIN, CHANNEL, TYPE_GRB);
8
9 u8 m_color[5][3] = { {255, 0, 0}, {0, 255, 0}, {0, 0, 255}, {255, 255, 255}, {0, 0, 0} };
10 int delayval = 100;
11
12 void setup() {
13     strip.begin();
14     strip.setBrightness(10);
15 }
16 void loop() {
17     for (int j = 0; j < 5; j++) {
18         for (int i = 0; i < LEDS_COUNT; i++) {
19             strip.setLedColorData(i, m_color[j][0], m_color[j][1], m_color[j][2]);
20             strip.show();
21             delay(delayval);
22         }
23         delay(500);
24     }
25 }
```

To use some libraries, first you need to include the library's header file.

```
1 #include "Freenove_WS2812_Lib_for_ESP32.h"
```

Define the pins connected to the ring, the number of LEDs on the ring, and RMT channel values.

```
3 #define LEDS_COUNT 1 // The number of led
4 #define LEDS_PIN    16 // define the pin connected to the led strip
5 #define CHANNEL     0 // RMT channel
```

Use the above parameters to create a ws2812 object strip.

```
7 Freenove_ESP32_WS2812 strip = Freenove_ESP32_WS2812(LEDS_COUNT, LEDS_PIN, CHANNEL, TYPE_GRB);
```

Define the color values to be used, as red, green, blue, white, and black.

```
9 u8 m_color[5][3] = { {255, 0, 0}, {0, 255, 0}, {0, 0, 255}, {255, 255, 255}, {0, 0, 0} };
```

Define a variable to set the time interval for each led to light up. The smaller the value is, the faster it will light up.

```
10 int delayval = 50;
```

Initialize strip() in setup() and set the brightness.

```
13 strip.begin();
14 strip.setBrightness(10);
```

In the loop(), there are two “for” loops, the internal for loop to light the LED one by one, and the external for loop to switch colors. strip.setLedColorData() is used to set the color, but it does not change immediately.

Only when strip.show() is called will the color data be sent to the LED to change the color.

```
17 for (int j = 0; j < 5; j++) {
18     for (int i = 0; i < LEDS_COUNT; i++) {
19         strip.setLedColorData(i, m_color[j][0], m_color[j][1], m_color[j][2]);
20         strip.show();
21         delay(delayval);
22     }
23     delay(500);
24 }
```

Reference

```
Freenove_ESP32_WS2812(u16 n = 8, u8 pin_gpio = 2, u8 chn = 0, LED_TYPE t = TYPE_GRB)
```

Constructor to create a Ws2812 object.

Before each use of the constructor, please add “#include "Freenove_WS2812_Lib_for_ESP32.h"

Parameters

n: The number of led.

pin_gpio: A pin connected to an led.

Chn: RMT channel, which uses channel 0 by default, has a total of eight channels, 0-7. This means that you can use eight LEDPixel modules for the display at the same time, and these modules do not interfere with each other

t: Types of LED.

TYPE_RGB: The sequence of Ws2812 module loading color is red, green and blue.

TYPE_RBG: The sequence of Ws2812 module loading color is red, blue and green.

TYPE_GRB: The sequence of Ws2812 module loading color is green, red and blue.

TYPE_GBR: The sequence of Ws2812 module loading color is green, blue and red.

TYPE_BRG: The sequence of Ws2812 module loading color is blue, red and green.

TYPE_BGR: The sequence of Ws2812 module loading color is blue, green and red.

```
void begin(void);
```

Initialize the Ws2812 object

```
void setLedColorData (u8 index, u8 r, u8 g, u8 b);
void setLedColorData (u8 index, u32 rgb);
void setLedColor (u8 index, u8 r, u8 g, u8 b);
void setLedColor (u8 index, u32 rgb);
```

Set the color of led with order number n.

```
void show(void);
```

Send the color data to the led and display the set color immediately.

```
void setBrightness(uint8_t);
```

Set the brightness of the LED.

https://github.com/Freenove/Freenove_WS2812_Lib_for_ESP32

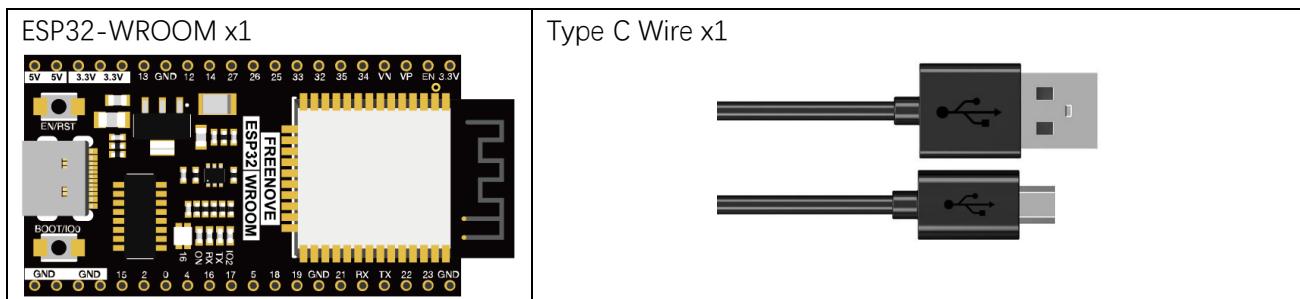

Chapter 3 Bluetooth

This chapter mainly introduces how to make simple data transmission through Bluetooth of ESP32-WROOM and mobile phones.

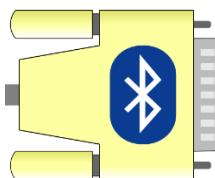

Project 3.1 is classic Bluetooth and Project 3.2 is low power Bluetooth. If you are an iPhone user, please start with Project 3.2.

Project 3.1 Bluetooth Passthrough

Component List

In this tutorial we need to use a Bluetooth APP called Serial Bluetooth Terminal to assist in the experiment. If you've not installed it yet, please do so by clicking: <https://www.appsapk.com/serial-bluetooth-terminal/> The following is its logo.

Component knowledge

ESP32's integrated Bluetooth function Bluetooth is a short-distance communication system, which can be divided into two types, namely Bluetooth Low Energy(BLE) and Classic Bluetooth. There are two modes for simple data transmission: master mode and slave mode.

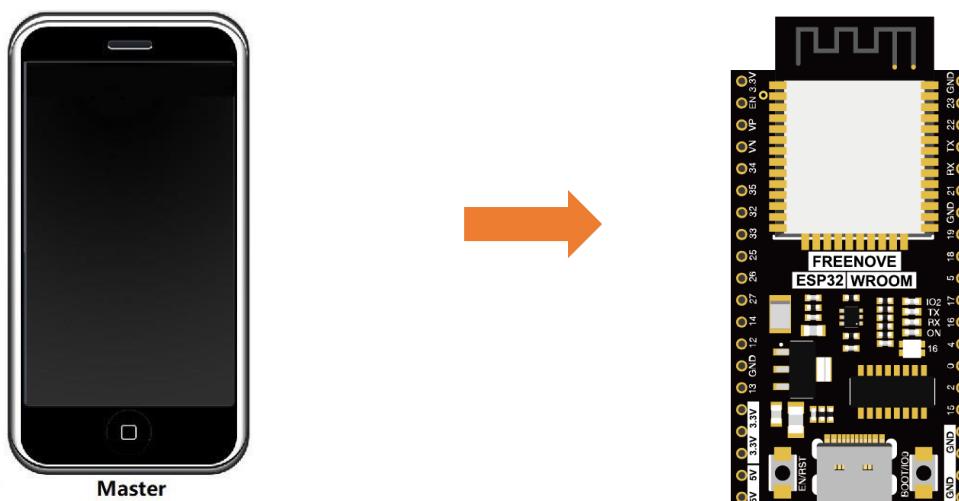

Master mode

In this mode, works are done in the master device and it can connect with a slave device. And we can search and select slave devices nearby to connect with. When a device initiates connection request in master mode, it requires information of the other Bluetooth devices including their address and pairing passkey. After finishing pairing, it can connect with them directly.

Slave mode

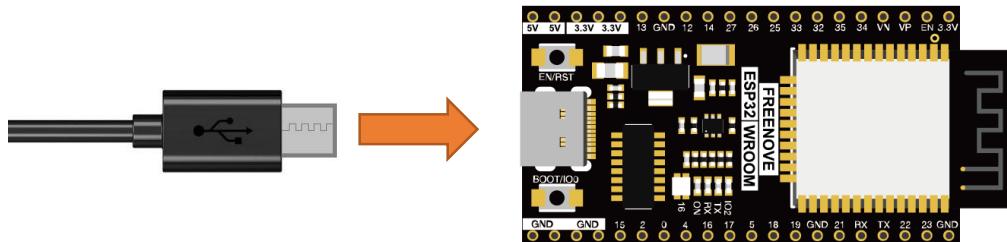

The Bluetooth module in slave mode can only accept connection request from a host computer, but cannot initiate a connection request. After connecting with a host device, it can send data to or receive from the host device.

Bluetooth devices can make data interaction with each other, as one is in master mode and the other in slave mode. When they are making data interaction, the Bluetooth device in master mode searches and selects devices nearby to connect to. When establishing connection, they can exchange data. When mobile phones exchange data with ESP32, they are usually in master mode and ESP32 in slave mode.

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Sketch

Sketch_03.1_SerialToSerialBT

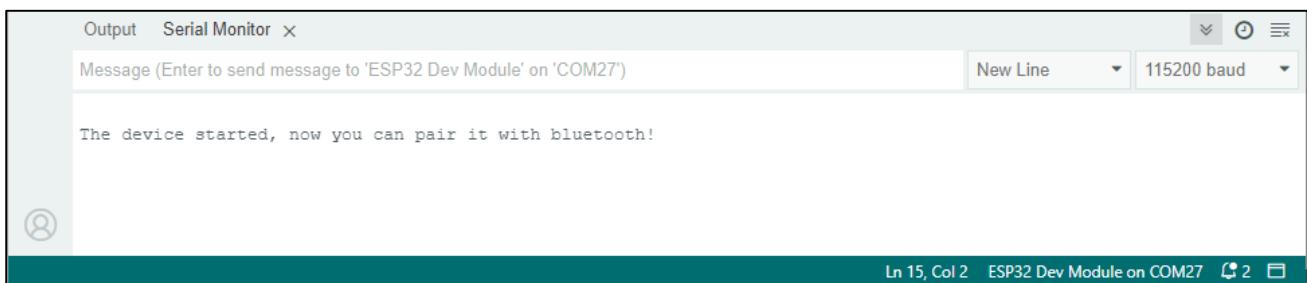

```

7 #include "BluetoothSerial.h"
8
9 BluetoothSerial SerialBT;
10 String buffer;
11 void setup() {
12   Serial.begin(115200);
13   SerialBT.begin("ESP32test"); //Bluetooth device name
14   Serial.println("\nThe device started, now you can pair it with bluetooth!");
15 }
16
17 void loop() {
18   if (Serial.available()) {
19     SerialBT.write(Serial.read());
20   }
21   if (SerialBT.available()) {
22     Serial.write(SerialBT.read());
23   }
24   delay(20);
25 }
26

```

The device started, now you can pair it with bluetooth!

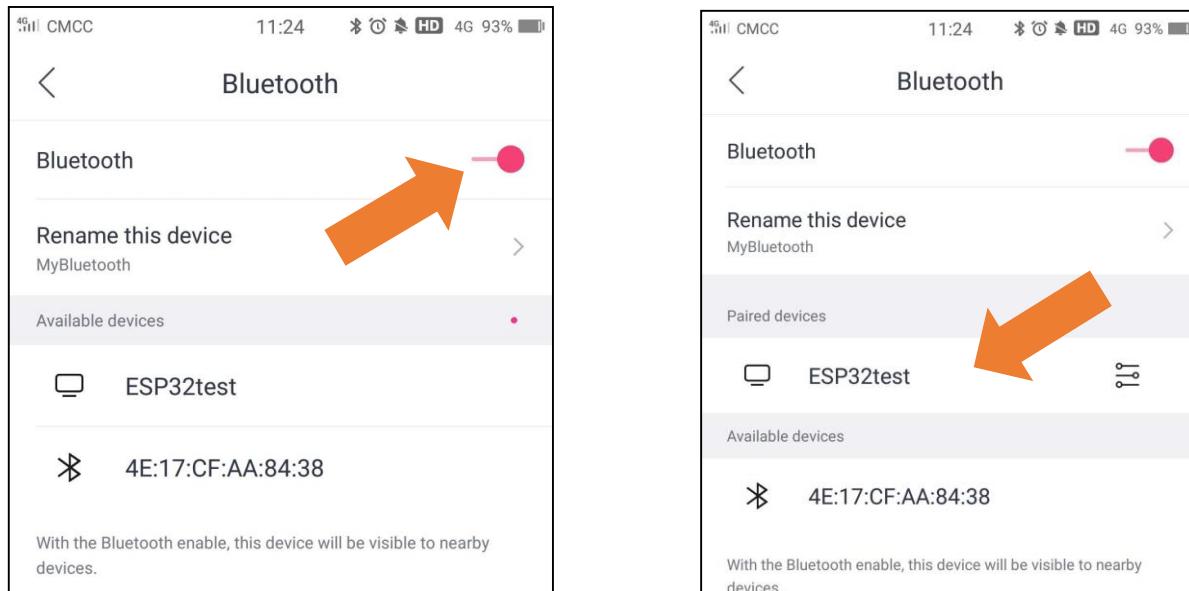

Compile and upload the code to the ESP32-WROOM, open the serial monitor, and set the baud rate to 115200. When you see the serial printing out the character string as below, it indicates that the Bluetooth of ESP32 is ready and waiting to connect with the mobile phone.

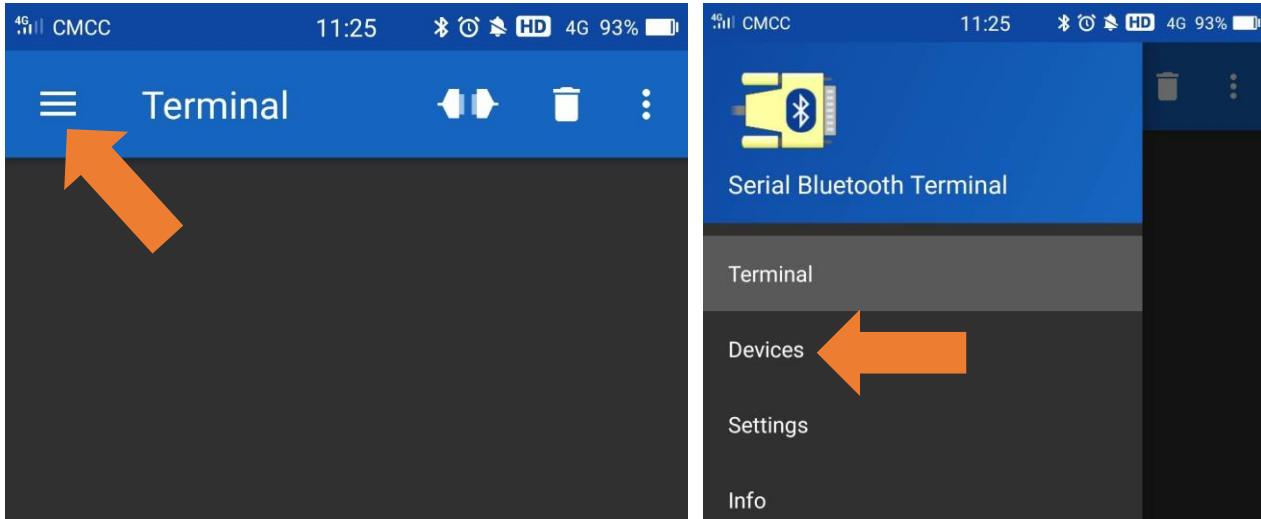

Make sure that the Bluetooth of your phone has been turned on and Serial Bluetooth Terminal has been installed.

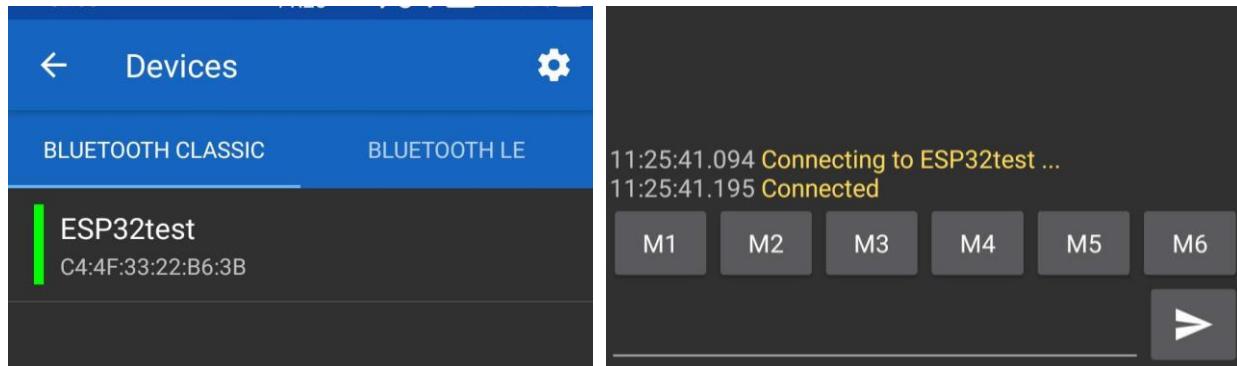

Click "Search" to search Bluetooth devices nearby and select "ESP32 test" to connect to.

Turn on software APP, click the left of the terminal. Select "Devices"

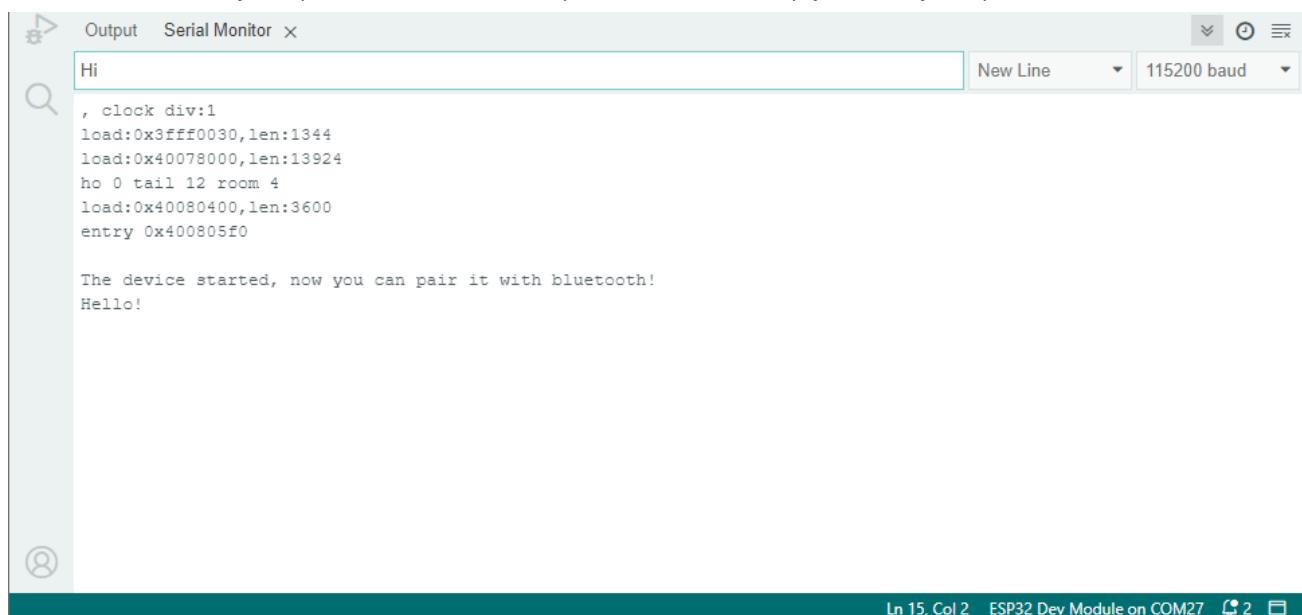

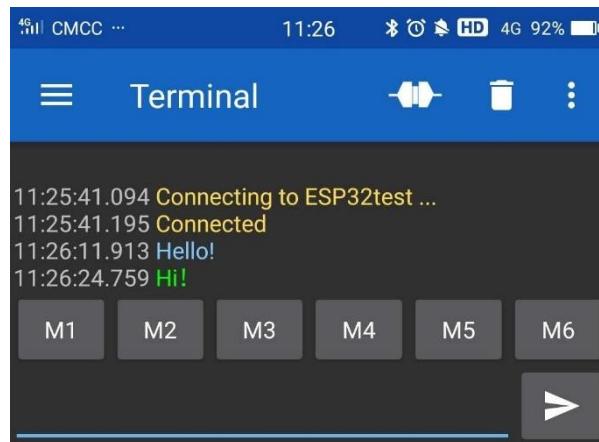

Select ESP32test in classic Bluetooth mode, and a successful connecting prompt will appear as shown on the right illustration.

And now data can be transferred between your mobile phone and computer via ESP32-WROOM.

Send 'Hello!' from your phone, when the computer receives it, reply "Hi" to your phone.

Reference

Class BluetoothSerial

This is a class library used to operate **BluetoothSerial**, which can directly read and set **BluetoothSerial**.

Here are some member functions:

begin(localName, isMaster): Initialization function of the Bluetooth

name: name of Bluetooth module; Data type: String

isMaster: bool type, whether to set Bluetooth as Master. By default, it is false.

available(): acquire digits sent from the buffer, if not, return 0.

read(): read data from Bluetooth, data type of return value is int.

readString(): read data from Bluetooth, data type of return value is String.

write(val): send an int data val to Bluetooth.

write(str): send an Sstring data str to Bluetooth.

write(buf, len): Sends the first len data in the buf Array to Bluetooth.

setPin(const char *pin): set a four-digit Bluetooth pairing code. By default, it is 1234

connect(remoteName): connect a Bluetooth named remoteName, data type: String

connect(remoteAddress []): connect the physical address of Bluetooth, data type: uint8-t.

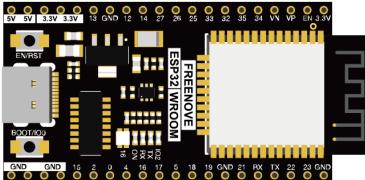

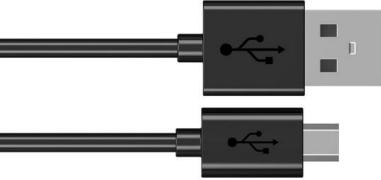

disconnect(): disconnect all Bluetooth devices.

end(): disconnect all Bluetooth devices and turn off the Bluetooth, release all occupied space

Ln 5, Col 27 ESP32 Dev Module on COM27

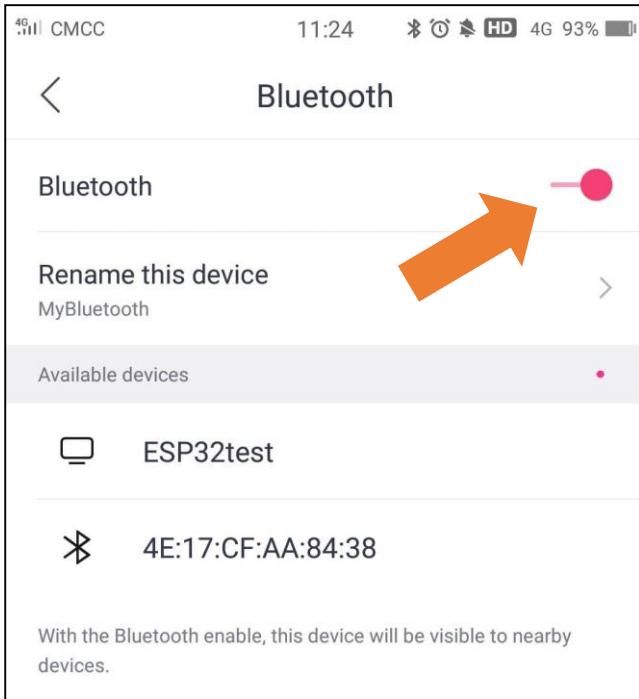

Serial Bluetooth

Compile and upload code to ESP32, the operation is similar to the last section.

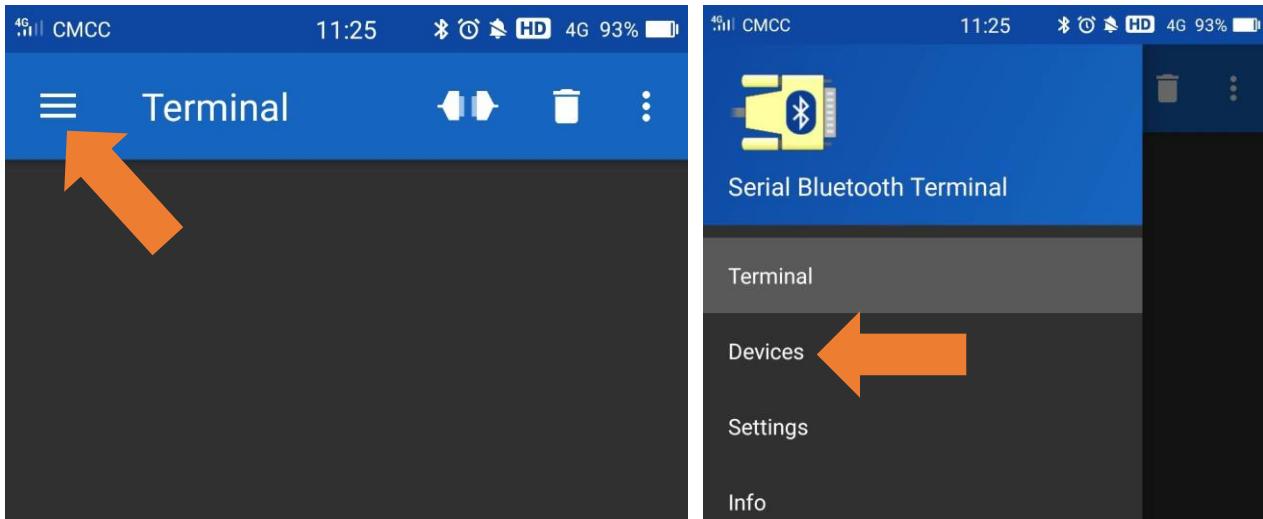

First, make sure you've turned on the mobile phone Bluetooth, and then open the software.

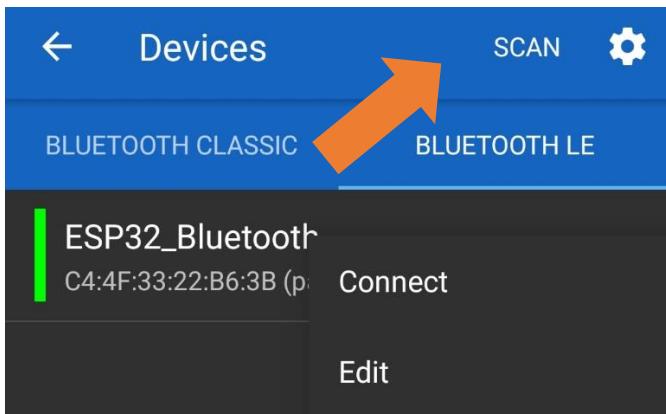

Click "Search" to search Bluetooth devices nearby and select "ESP32 test" to connect to.

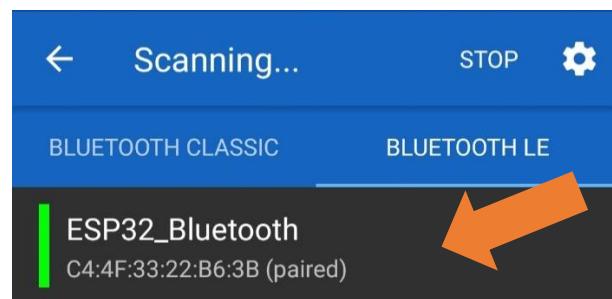

Turn on software APP, click the left of the terminal. Select "Devices"

Select BLUETOOTHLE, click SCAN to scan Low Energy Bluetooth devices nearby.

Select "ESP32-Bluetooth"

Lightblue

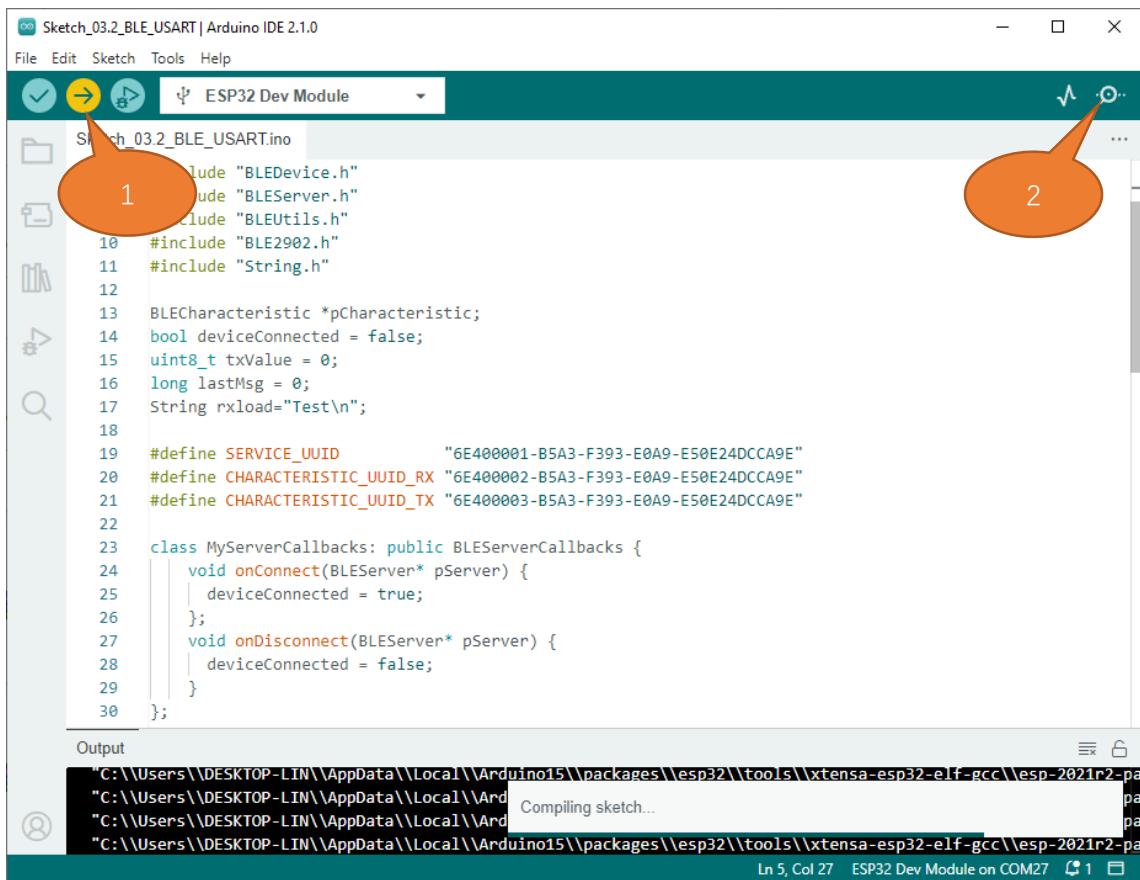

If you can't install Serial Bluetooth on your phone, try LightBlue. If you do not have this software installed on your phone, you can refer to this link:

<https://apps.apple.com/us/app/lightblue/id557428110#?platform=iphone.>

The screenshot displays the LightBlue app interface on an iPhone. On the left, there's a list of nearby peripherals, including 'Health Monitor', 'Matt's Mug', 'Thed's Arduino Uno', 'Gretchen's Fitbit Blaze', 'Heart Rate Monitor', 'Colin's iPhone Xs', 'Sous Vide Bean', 'Mike's MacBook Pro', 'PT DevKit', and another 'Health Monitor'. On the right, a detailed view of a selected 'Temperature Measurement' peripheral is shown. The peripheral has a UUID of 2A1C and is connected. It lists various properties and descriptors. At the bottom, there are controls for byte count and endianness.

Step1. Upload the code to ESP32.

Step2. Click on serial monitor.

```

Test

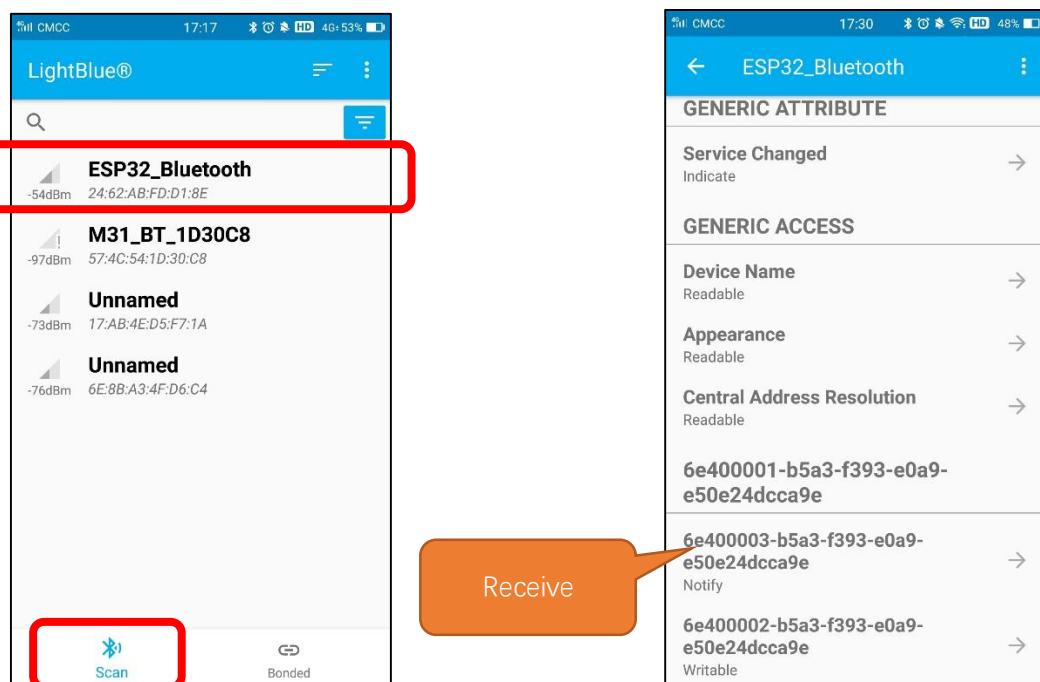

```

Ln 59, Col 15 ESP32 Dev Module on COM27 2

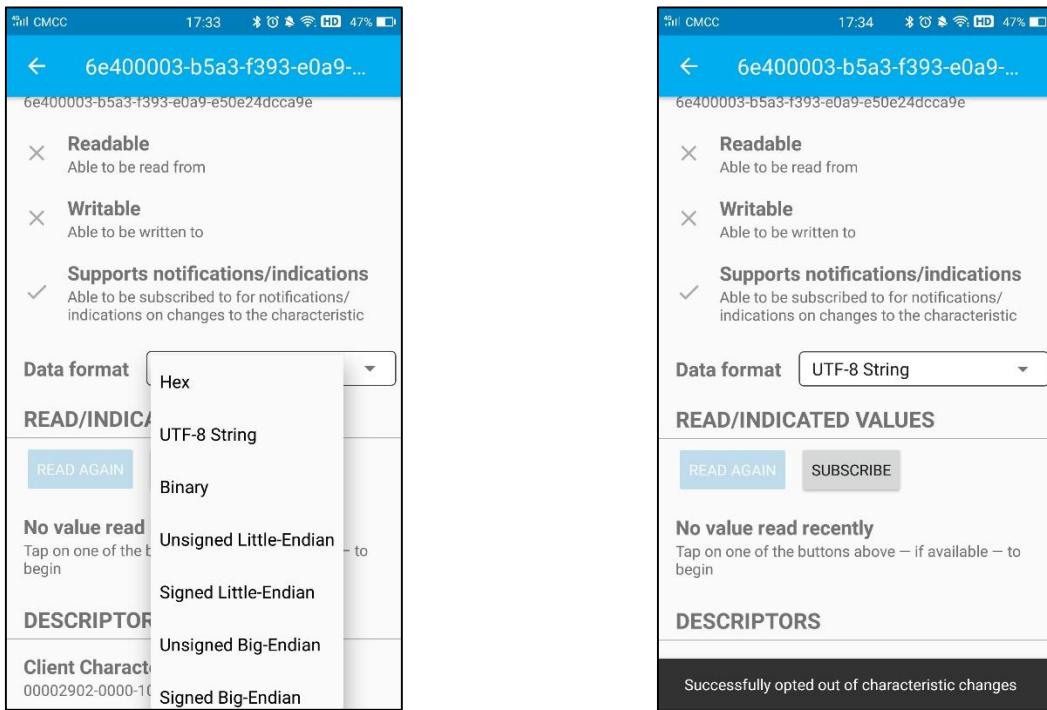

Turn ON Bluetooth on your phone, and open the Lightblue APP.

In the Scan page, swipe down to refresh the name of Bluetooth that the phone searches for. Click ESP32_Bluetooth.

Click "Receive". Select the appropriate Data format in the box to the right of Data Format. For example, HEX for hexadecimal, utf-string for character, Binary for Binary, etc. Then click SUBSCRIBE.

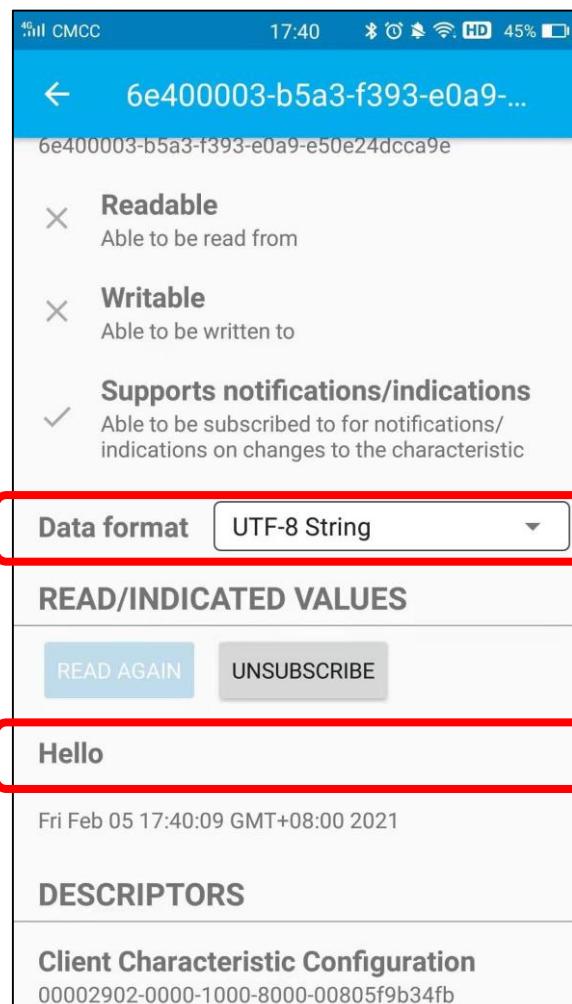

Back to the serial monitor on your computer. You can type anything in the left border of Send, and then click Send.

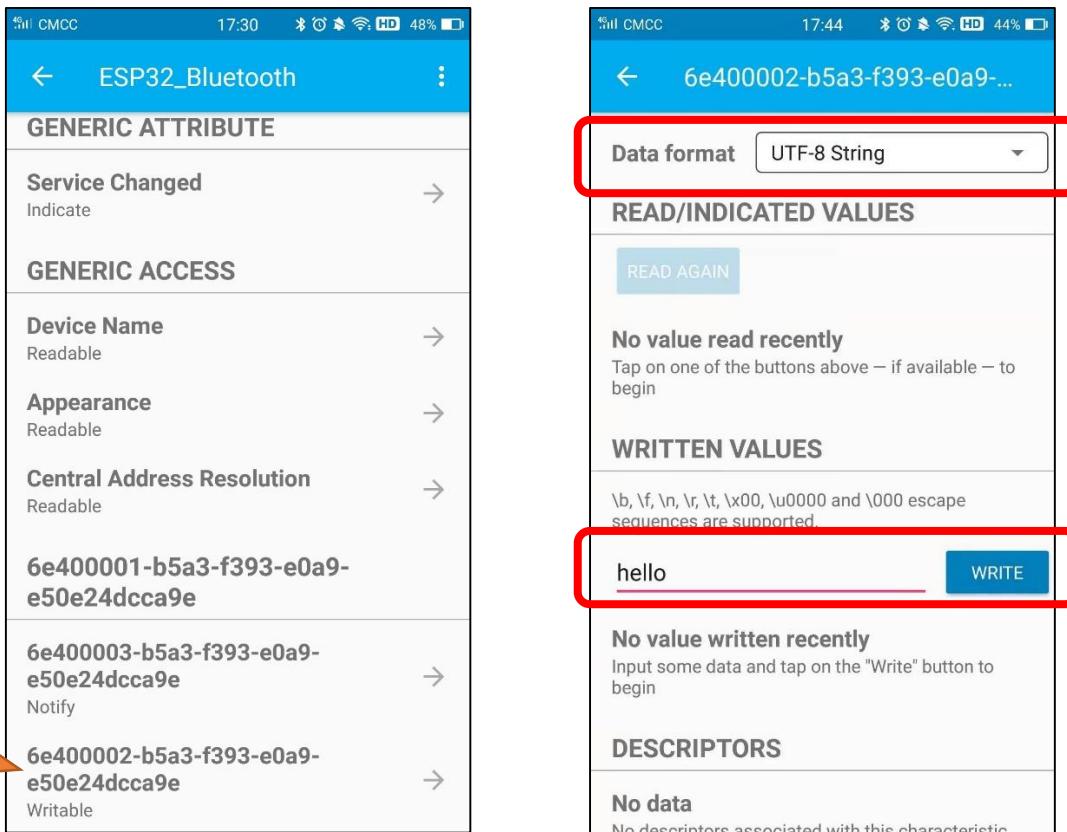

The screenshot shows a Serial Monitor window titled "Serial Monitor". The message "Hello" is typed into the "Send" field and has been transmitted. The received message is displayed in the main text area:

```
ets Jul 29 2019 12:21:46
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0xee

64             Serial.println(rxload);
65             rxload="";
66         }
67         if(Serial.available()>0) {
68             String str=Serial.readString();
69             const char *newValue=str.c_str();
70             pCharacteristic->setValue(newValue);
71             pCharacteristic->notify();
72         }
73         lastMsg = now;
74     }
75 }
```

Define the specified UUID number for BLE vendor.

13	#define SERVICE_UUID "6E400001-B5A3-F393-E0A9-E50E24DCCA9E"
14	#define CHARACTERISTIC_UUID_RX "6E400002-B5A3-F393-E0A9-E50E24DCCA9E"
15	#define CHARACTERISTIC_UUID_TX "6E400003-B5A3-F393-E0A9-E50E24DCCA9E"

Write a Callback function for BLE server to manage connection of BLE.

```

17 class MyServerCallbacks: public BLEServerCallbacks {
18     void onConnect(BLEServer* pServer) {
19         deviceConnected = true;
20     };
21     void onDisconnect(BLEServer* pServer) {
22         deviceConnected = false;
23     }
24 };

```

Write Callback function with BLE features. When it is called, as the mobile terminal send data to ESP32, it will store them into reload.

```

26 class MyCallbacks: public BLECharacteristicCallbacks {
27     void onWrite(BLECharacteristic *pCharacteristic) {
28         std::string rxValue = pCharacteristic->getValue();
29         if (rxValue.length() > 0) {
30             rxload="";
31             for (int i = 0; i < rxValue.length(); i++) {
32                 rxload +=(char)rxValue[i];
33             }
34         }
35     }
36 };

```

Initialize the BLE function and name it.

```
55 setupBLE("ESP32_Bluetooth");
```

When the mobile phone send data to ESP32 via BLE Bluetooth, it will print them out with serial port; When the serial port of ESP32 receive data, it will send them to mobile via BLE Bluetooth.

```

59 long now = millis();
60 if (now - lastMsg > 1000) {
61     if (deviceConnected&&rxload.length()>0) {
62         Serial.println(rxload);
63         rxload="";
64     }
65     if(Serial.available()>0) {
66         String str=Serial.readString();
67         const char *newValue=str.c_str();
68         pCharacteristic->setValue(newValue);
69         pCharacteristic->notify();
70     }
71     lastMsg = now;
72 }

```

The design for creating the BLE server is:

1. Create a BLE Server
2. Create a BLE Service
3. Create a BLE Characteristic on the Service
4. Create a BLE Descriptor on the characteristic
5. Start the service.
6. Start advertising.

```
38 void setupBLE(String BLEName) {  
39     const char *ble_name=BLEName.c_str();  
40     BLEDevice::init(ble_name);  
41     BLEServer *pServer = BLEDevice::createServer();  
42     pServer->setCallbacks(new MyServerCallbacks());  
43     BLEService *pService = pServer->createService(SERVICE_UUID);  
44     pCharacteristic=  
45         pService->createCharacteristic(CHARACTERISTIC_UUID_TX,BLECharacteristic::PROPERTY_NOTIFY);  
46     pCharacteristic->addDescriptor(new BLE2902());  
47     BLECharacteristic *pCharacteristic =  
48         pService->createCharacteristic(CHARACTERISTIC_UUID_RX,BLECharacteristic::PROPERTY_WRITE);  
49     pCharacteristic->setCallbacks(new MyCallbacks());  
50     pService->start();  
51     pServer->getAdvertising()->start();  
52     Serial.println("Waiting a client connection to notify...");  
53 }
```

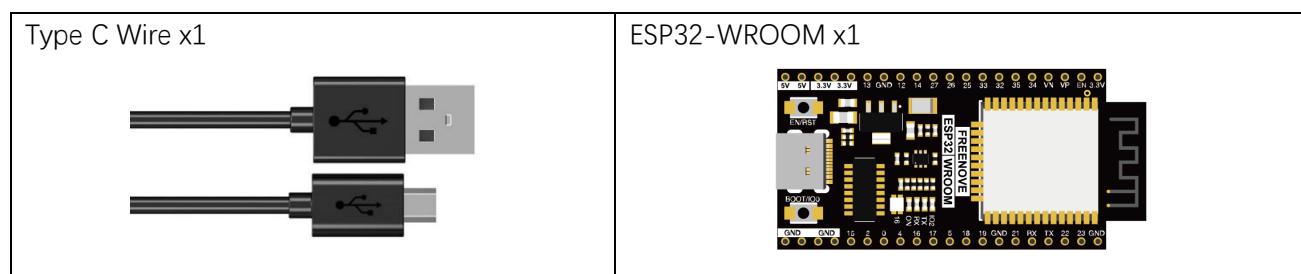

Chapter 4 WiFi Working Modes

In this chapter, we'll focus on the WiFi infrastructure for ESP32-WROOM.

ESP32-WROOM has 3 different WiFi operating modes: station mode, AP mode and AP+station mode. All WiFi programming projects must be configured with WiFi operating mode before using WiFi, otherwise WiFi cannot be used.

Project 4.1 Station mode

Component List

Component knowledge

Station mode

When ESP32 selects Station mode, it acts as a WiFi client. It can connect to the router network and communicate with other devices on the router via WiFi connection. As shown below, the PC is connected to the router, and if ESP32 wants to communicate with the PC, it needs to be connected to the router.

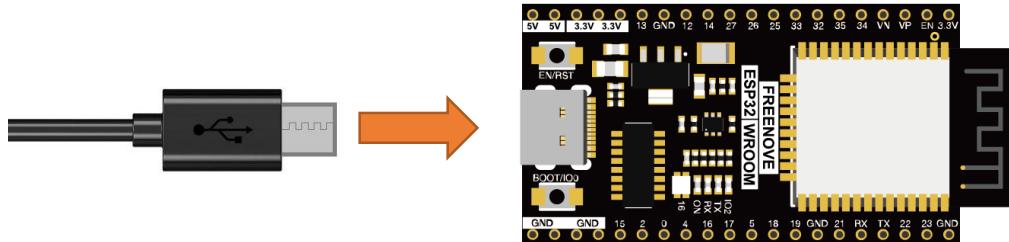

Any concerns? ✉ support@freenove.com

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Sketch

Sketch_04.1_Station_mode

```

When ESP32-WROOM successfully connects to “ssid_Router”, serial monitor will print out the IP address assigned to ESP32-WROOM by the router.

The following is the program code:

```
1 #include <WiFi.h>
2
3 const char *ssid_Router      = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
5
6 void setup() {
7     Serial.begin(115200);
8     delay(2000);
9     Serial.println("Setup start");
10    WiFi.begin(ssid_Router, password_Router);
11    Serial.println(String("Connecting to ") + ssid_Router);
12    while (WiFi.status() != WL_CONNECTED) {
13        delay(500);
14        Serial.print(".");
15    }
16    Serial.println("\nConnected, IP address: ");
17    Serial.println(WiFi.localIP());
18    Serial.println("Setup End");
19 }
20
21 void loop() {
22 }
```

Include the WiFi Library header file of ESP32.

```
1 #include <WiFi.h>
```

Enter correct router name and password.

```
3 const char *ssid_Router      = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
```

Set ESP32 in Station mode and connect it to your router.

```
10 WiFi.begin(ssid_Router, password_Router);
```

Any concerns? ✉ support@freenove.com

Check whether ESP32 has connected to router successfully every 0.5s.

```
12   while (WiFi.status() != WL_CONNECTED) {  
13     delay(500);  
14     Serial.print(".");
15 }
```

Serial monitor prints out the IP address assigned to ESP32-WROOM

```
17   Serial.println(WiFi.localIP());
```

Reference

Class Station

Every time when using WiFi, you need to include header file "WiFi.h".

begin(ssid, password,channel, bssid, connect): ESP32 is used as Station to connect hotspot.

ssid: WiFi hotspot name

password: WiFi hotspot password

channel: WiFi hotspot channel number; communicating through specified channel; optional parameter

bssid: mac address of WiFi hotspot, optional parameter

connect: boolean optional parameter, defaulting to true. If set as false, then ESP32 won't connect WiFi.

config(local_ip, gateway, subnet, dns1, dns2): set static local IP address.

local_ip: station fixed IP address.

subnet: subnet mask

dns1,dns2: optional parameter. define IP address of domain name server

status: obtain the connection status of WiFi

local IP(): obtain IP address in Station mode

disconnect(): disconnect wifi

setAutoConnect(boolen): set automatic connection Every time ESP32 is power on, it will connect WiFi automatically.

setAutoReconnect(boolen): set automatic reconnection Every time ESP32 disconnects WiFi, it will reconnect to WiFi automatically.

Project 4.2 AP mode

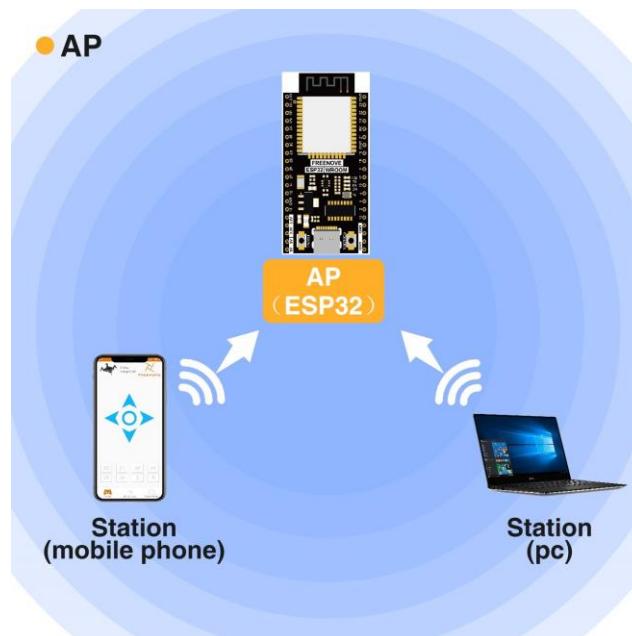

Component List & Circuit

Component List & Circuit are the same as in Section 30.1.

Component knowledge

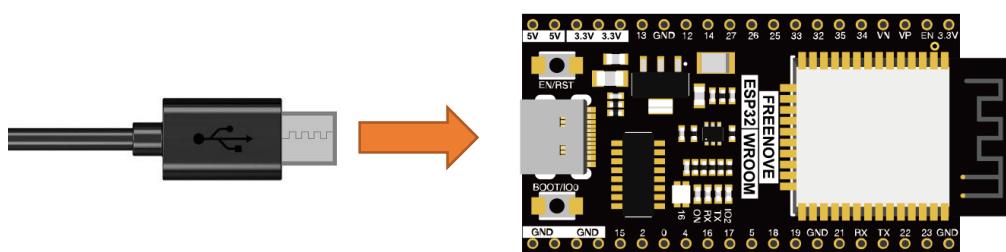

AP mode

When ESP32 selects AP mode, it creates a hotspot network that is separate from the Internet and waits for other WiFi devices to connect. As shown in the figure below, ESP32 is used as a hotspot. If a mobile phone or PC wants to communicate with ESP32, it must be connected to the hotspot of ESP32. Only after a connection is established with ESP32 can they communicate.

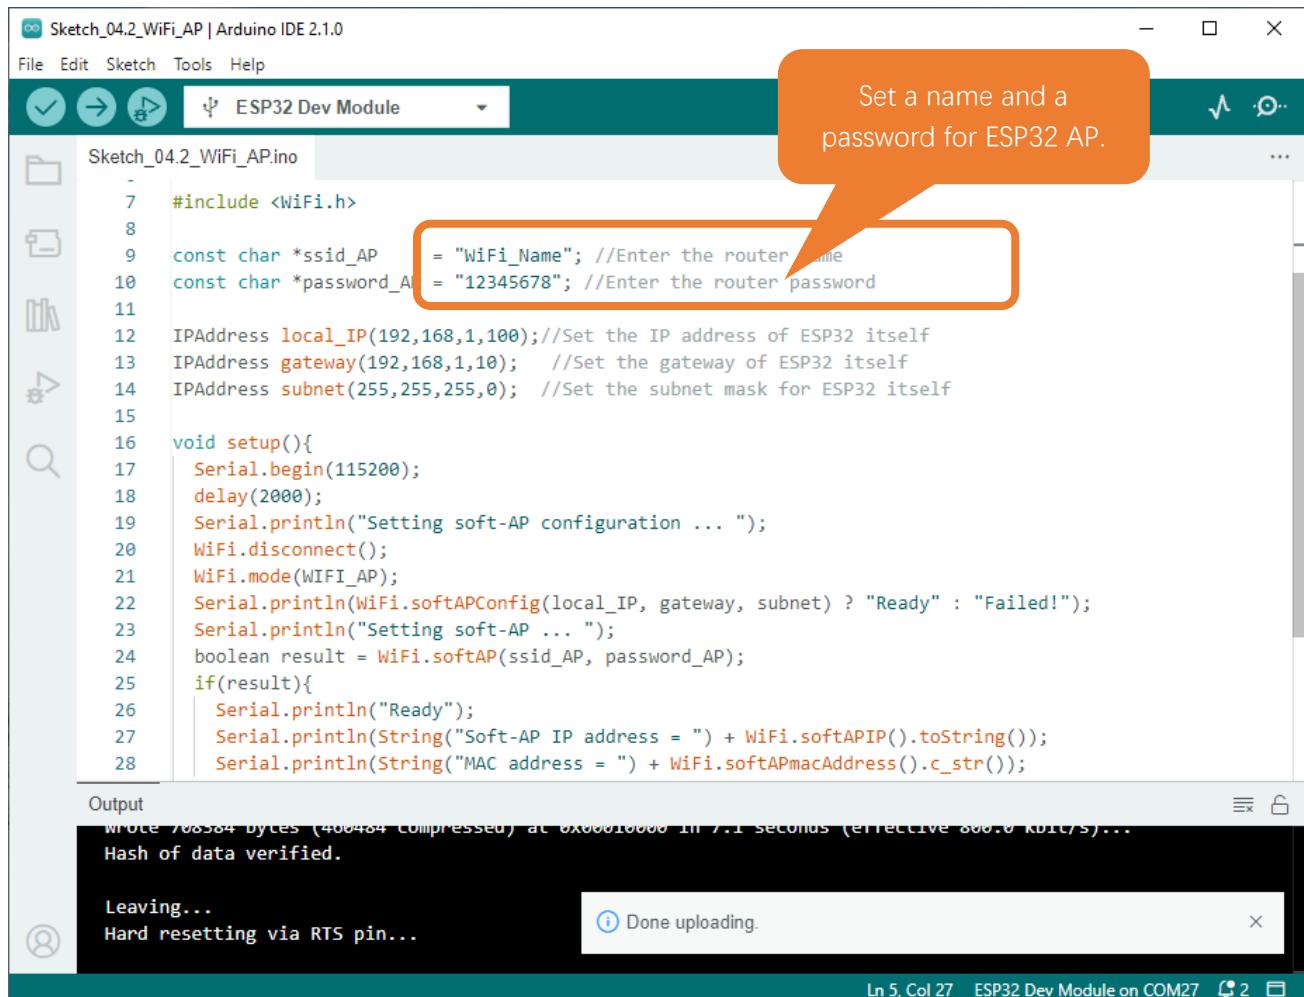

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Any concerns? ✉ support@freenove.com

Sketch

The screenshot shows the Arduino IDE interface with the sketch `Sketch_04.2_WiFi_AP.ino` open. The code is for an ESP32 Dev Module. A callout bubble highlights the configuration lines for the WiFi AP:

```

7 #include <WiFi.h>
8
9 const char *ssid_AP = "WiFi_Name"; //Enter the router name
10 const char *password_AP = "12345678"; //Enter the router password
11
12 IPAddress local_IP(192,168,1,100); //Set the IP address of ESP32 itself
13 IPAddress gateway(192,168,1,10); //Set the gateway of ESP32 itself
14 IPAddress subnet(255,255,255,0); //Set the subnet mask for ESP32 itself
15
16 void setup(){
17     Serial.begin(115200);
18     delay(2000);
19     Serial.println("Setting soft-AP configuration ... ");
20     WiFi.disconnect();
21     WiFi.mode(WIFI_AP);
22     Serial.println(WiFi.softAPConfig(local_IP, gateway, subnet) ? "Ready" : "Failed!");
23     Serial.println("Setting soft-AP ... ");
24     boolean result = WiFi.softAP(ssid_AP, password_AP);
25     if(result){
26         Serial.println("Ready");
27         Serial.println(String("Soft-AP IP address = ") + WiFi.softAPIP().toString());
28         Serial.println(String("MAC address = ") + WiFi.softAPmacAddress().c_str());
    
```

The output window shows the upload process completed successfully:

```

Output
wrote 706584 bytes (400484 compressed) at 0x00001000 in 7.1 seconds (effective 800.0 kbit/s)...
Hash of data verified.

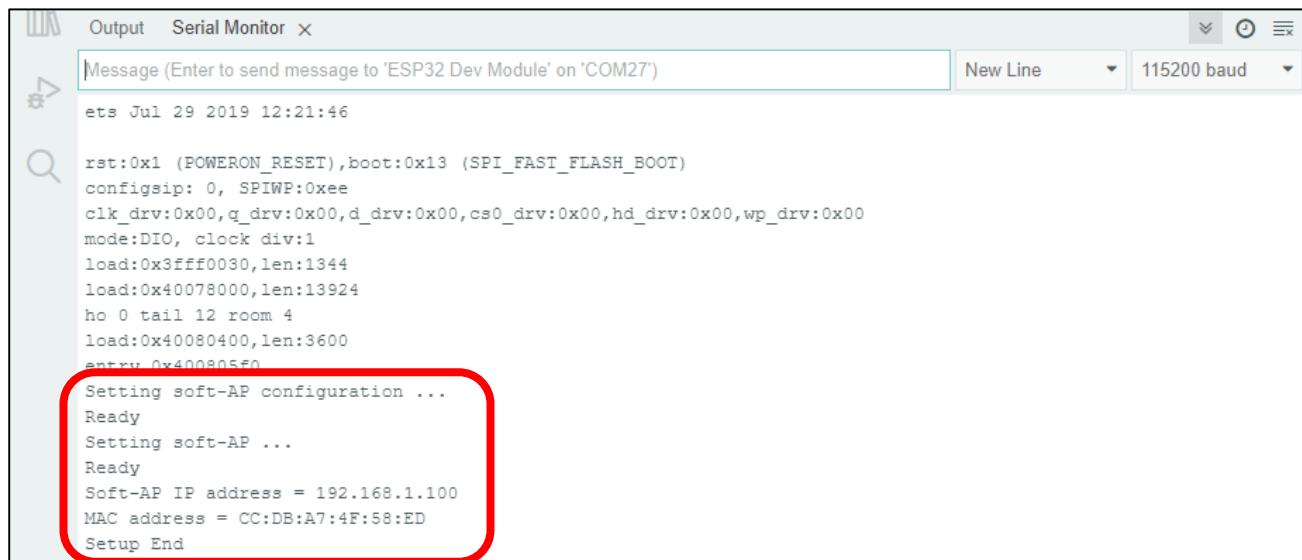

Leaving...
Hard resetting via RTS pin...

```

A progress bar indicates "Done uploading." in the status bar.

Before the Sketch runs, you can make any changes to the AP name and password for ESP32 in the box as shown in the illustration above. Of course, you can leave it alone by default.

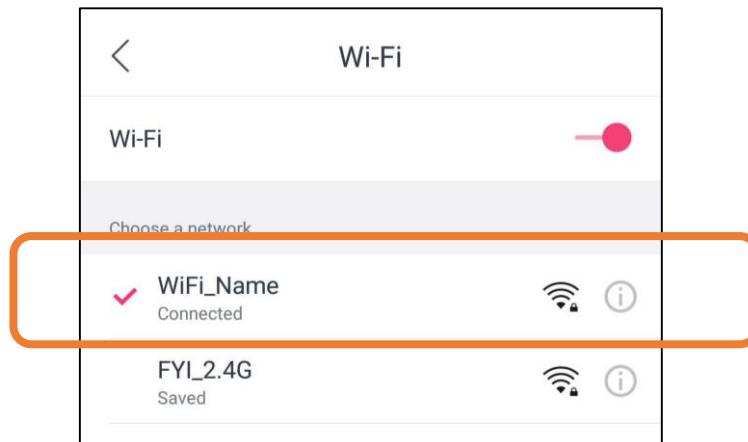

Compile and upload codes to ESP32-WROOM, open the serial monitor and set the baud rate to 115200. And then it will display as follows.

A screenshot of the Arduino Serial Monitor window. The title bar says "Output Serial Monitor". The message area shows boot-up logs and configuration details. A red box highlights the following text:

```
Setting soft-AP configuration ...
Ready
Setting soft-AP ...
Ready
Soft-AP IP address = 192.168.1.100
MAC address = CC:DB:A7:4F:58:ED
Setup End
```

When observing the print information of the serial monitor, turn on the WiFi scanning function of your phone, and you can see the ssid_AP on ESP32, which is called "WiFi_Name" in this Sketch. You can enter the password "12345678" to connect it or change its AP name and password by modifying Sketch.

Sketch_04_2_AP_mode

The following is the program code:

```

1 #include <WiFi.h>
2
3 const char *ssid_AP      = "WiFi_Name"; //Enter the router name
4 const char *password_AP = "12345678"; //Enter the router password
5
6 IPAddress local_IP(192, 168, 1, 100); //Set the IP address of ESP32 itself
7 IPAddress gateway(192, 168, 1, 10); //Set the gateway of ESP32 itself
8 IPAddress subnet(255, 255, 255, 0); //Set the subnet mask for ESP32 itself
9
10 void setup() {
11     Serial.begin(115200);
12     delay(2000);
13     Serial.println("Setting soft-AP configuration ... ");
14     WiFi.disconnect();
15     WiFi.mode(WIFI_AP);
16     Serial.println(WiFi.softAPConfig(local_IP, gateway, subnet) ? "Ready" : "Failed!");
17     Serial.println("Setting soft-AP ... ");
18     boolean result = WiFi.softAP(ssid_AP, password_AP);
19     if(result){
20         Serial.println("Ready");
21         Serial.println(String("Soft-AP IP address = ") + WiFi.softAPIP().toString());
22         Serial.println(String("MAC address = ") + WiFi.softAPmacAddress().c_str());
23     }else{
24         Serial.println("Failed!");
25     }
26     Serial.println("Setup End");
27 }
28
29 void loop() {
30 }
```

Include WiFi Library header file of ESP32.

```
1 #include <WiFi.h>
```

Enter correct AP name and password.

```

3 const char *ssid_AP      = "WiFi_Name"; //Enter the router name
4 const char *password_AP = "12345678"; //Enter the router password
```

Set ESP32 in AP mode.

```
15 WiFi.mode(WIFI_AP);
```

Configure IP address, gateway and subnet mask for ESP32.

```
16 WiFi.softAPConfig(local_IP, gateway, subnet)
```

Turn on an AP in ESP32, whose name is set by ssid_AP and password is set by password_AP.

```
18 WiFi.softAP(ssid_AP, password_AP);
```

Check whether the AP is turned on successfully. If yes, print out IP and MAC address of AP established by ESP32. If no, print out the failure prompt.

```
19 if(result){  
20     Serial.println("Ready");  
21     Serial.println(String("Soft-AP IP address = ") + WiFi.softAPIP().toString());  
22     Serial.println(String("MAC address = ") + WiFi.softAPmacAddress().c_str());  
23 }else{  
24     Serial.println("Failed!");  
25 }  
26 Serial.println("Setup End");
```

Reference

Class AP

Every time when using WiFi, you need to include header file "WiFi.h".

softAP(ssid, password, channel, ssid_hidden, max_connection):

ssid: WiFi hotspot name

password: WiFi hotspot password

channel: Number of WiFi connection channels, range 1-13. The default is 1.

ssid_hidden: Whether to hide WiFi name from scanning by other devices. The default is not hide.

max_connection: Maximum number of WiFi connected devices. The range is 1-4. The default is 4.

softAPConfig(local_ip, gateway, subnet): set static local IP address.

local_ip: station fixed IP address.

Gateway: gateway IP address

subnet: subnet mask

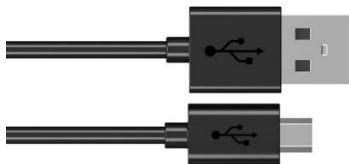

softAP(): obtain IP address in AP mode

softAPdisconnect (): disconnect AP mode.

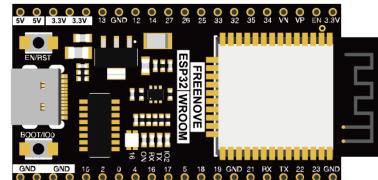

Project 4.3 AP+Station mode

Component List

Type C Wire x1

ESP32-WROOM x1

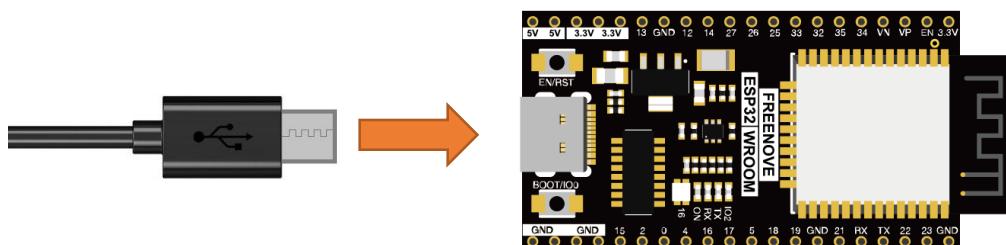

Component knowledge

AP+Station mode

In addition to AP mode and station mode, ESP32 can also use AP mode and station mode at the same time. This mode contains the functions of the previous two modes. Turn on ESP32's station mode, connect it to the router network, and it can communicate with the Internet via the router. At the same time, turn on its AP mode to create a hotspot network. Other WiFi devices can choose to connect to the router network or the hotspot network to communicate with ESP32.

Circuit

Connect Freenove ESP32 to the computer using the USB cable.

Chapter 5 TCP/IP

In this chapter, we will introduce how ESP32 implements network communications based on TCP/IP protocol. There are two roles in TCP/IP communication, namely Server and Client, which will be implemented respectively with two projects in this chapter.

Project 5.1 As Client

In this section, ESP32 is used as Client to connect Server on the same LAN and communicate with it.

Component List

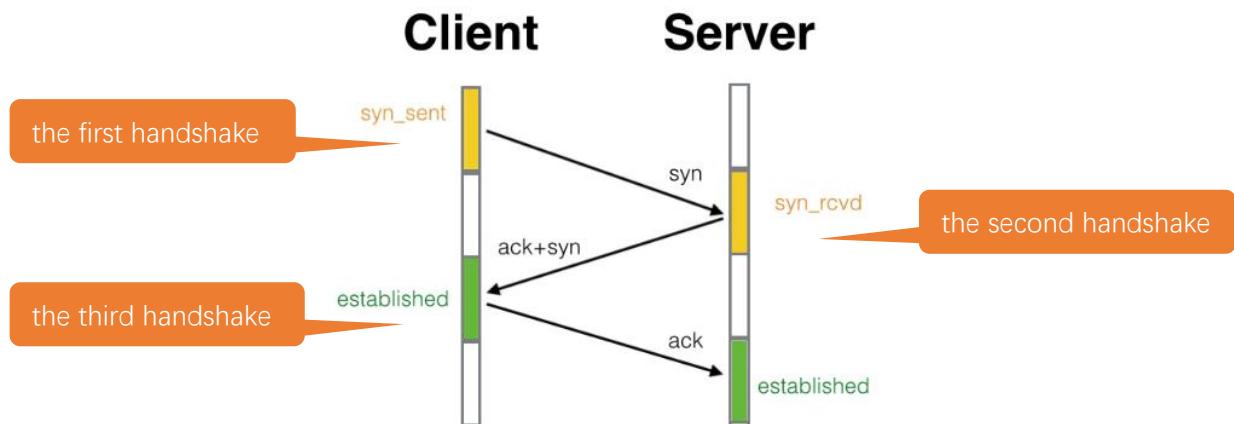

Component knowledge

TCP connection

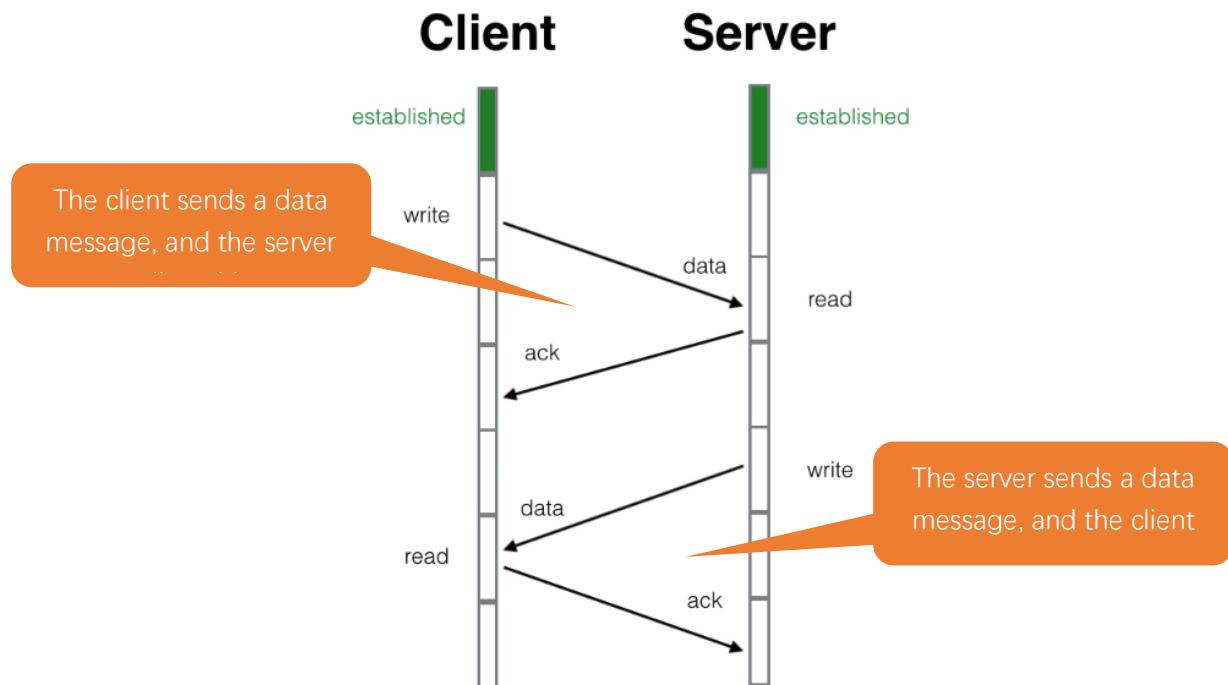

Before transmitting data, TCP needs to establish a logical connection between the sending end and the receiving end. It provides reliable and error-free data transmission between the two computers. In the TCP connection, the client and the server must be clarified. The client sends a connection request to the server, and each time such a request is proposed, a "three-times handshake" is required.

Three-times handshake: In the TCP protocol, during the preparation phase of sending data, the client and the server interact three times to ensure the reliability of the connection, which is called "three-times handshake". The first handshake, the client sends a connection request to the server and waits for the server to confirm. The second handshake, the server sends a response back to the client informing that it has received the connection request.

The third handshake, the client sends a confirmation message to the server again to confirm the connection.

TCP is a connection-oriented, low-level transmission control protocol. After TCP establishes a connection, the client and server can send and receive messages to each other, and the connection will always exist as long as the client or server does not initiate disconnection. Each time one party sends a message, the other party will reply with an ack signal.

Install Processing

In this tutorial, we use Processing to build a simple TCP/IP communication platform.

If you've not installed Processing, you can download it by clicking <https://processing.org/download/>. You can choose an appropriate version to download according to your PC system.

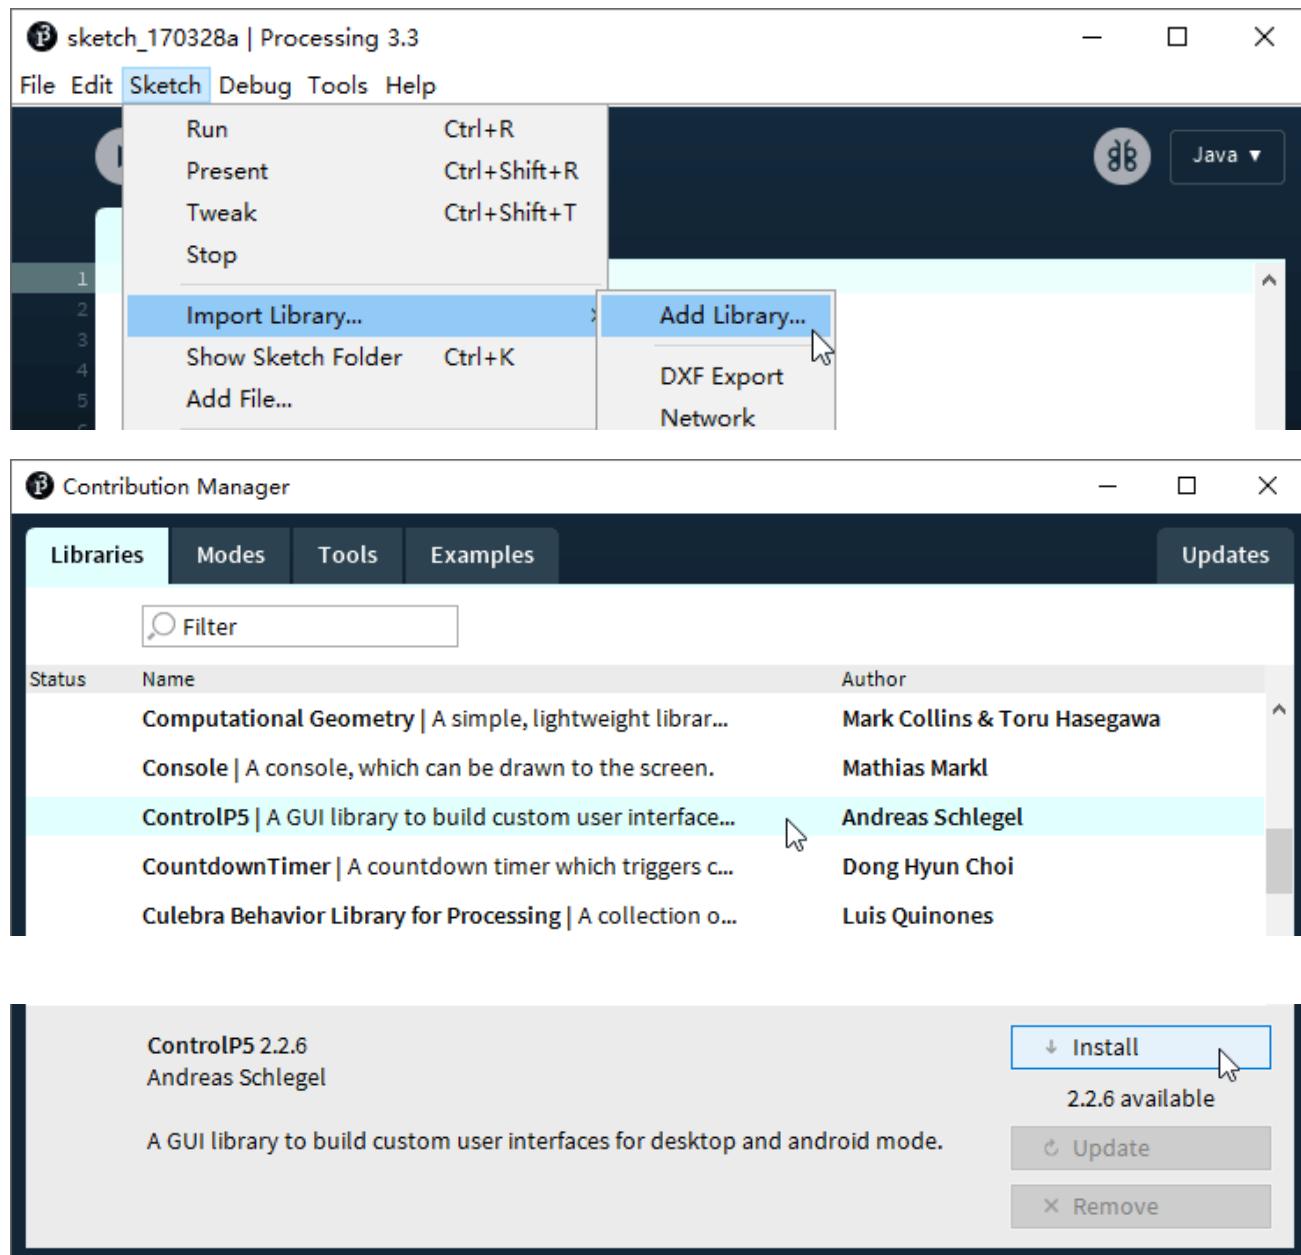

The screenshot shows the official Processing website's download section. At the top, there are navigation links for "Processing", "p5.js", "Processing.py", "Processing for Android", "Processing for Pi", and "Processing Foundation". Below this is a search bar. The main content area features a large "Processing" logo on the left and a central text block that reads: "Download Processing. Processing is available for Linux, Mac OS X, and Windows. Select your choice to download the software below." To the right of this text are download links for "Windows 64-bit", "Windows 32-bit", "Linux 64-bit", and "Mac OS X". On the far left, there is a sidebar with links to "Cover", "Download", "Donate", "Exhibition", "Reference", "Libraries", "Tools", "Environment", "Tutorials", "Examples", "Books", "Overview", and "People". In the center, there is a large circular icon containing a stylized letter "P". Below the download links, there is a note: "Read about the [changes in 3.0](#). The list of revisions covers the differences between releases in detail."

Unzip the downloaded file to your computer. Click "processing.exe" as the figure below to run this software.

Use Server mode for communication

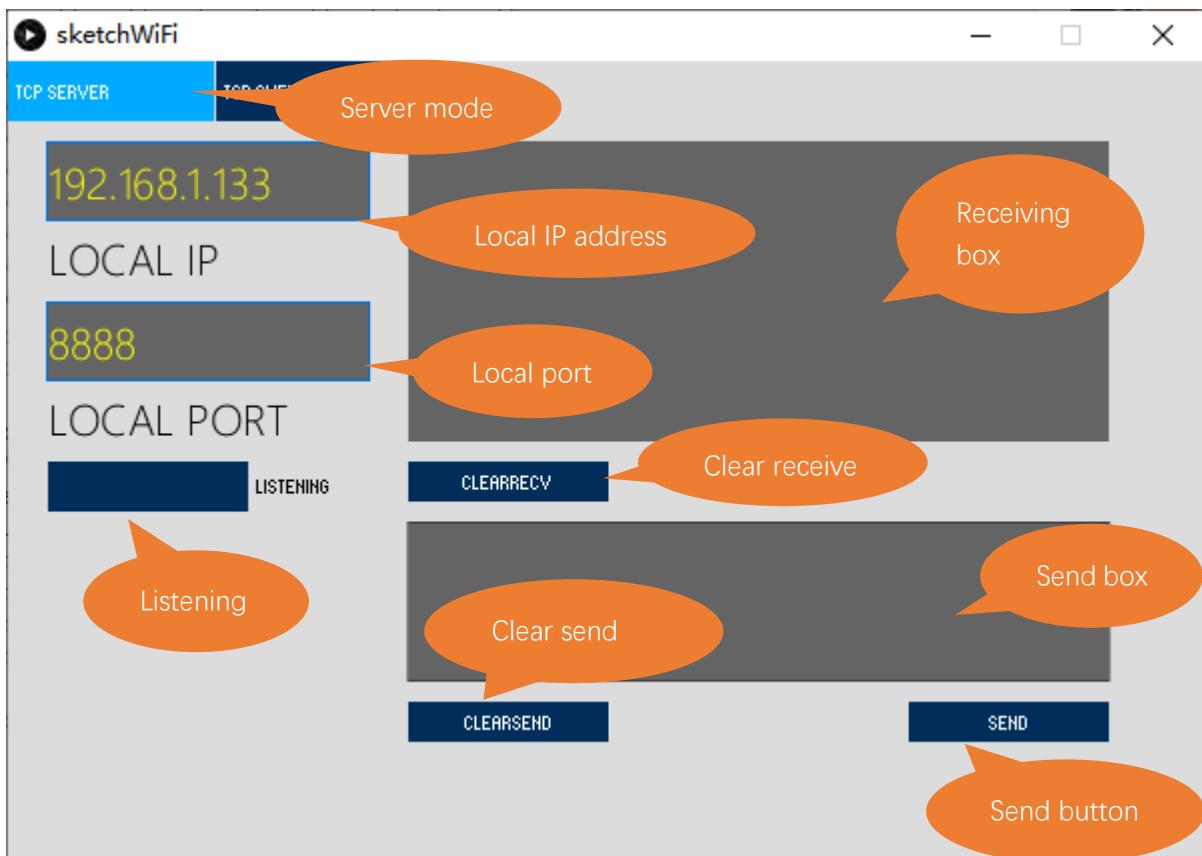

Install ControlP5.

Open the “**Freenove_ESP32_WROOM_Board\Sketches\Sketches\Sketch_05.1_WiFiClient\sketchWiFi\sketchWiFi.pde**”, and click “Run”.

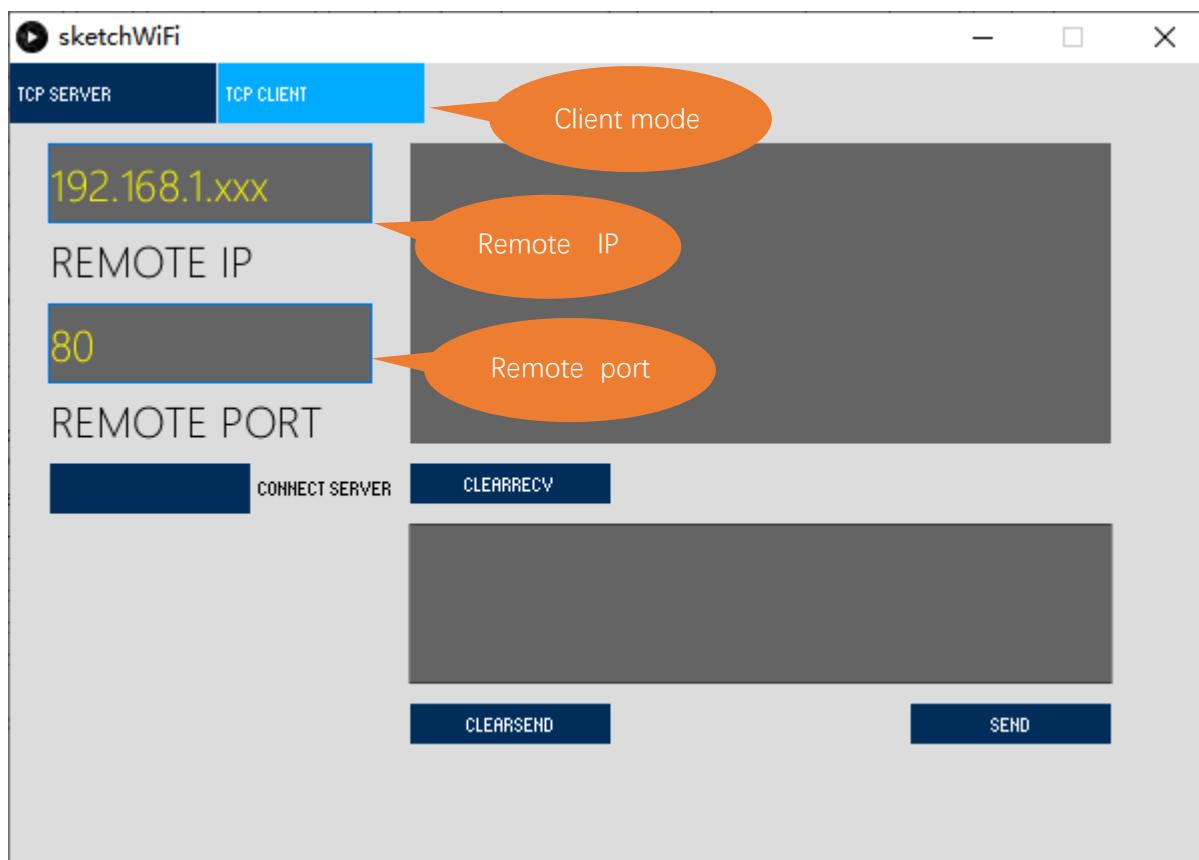

The new pop-up interface is as follows. If ESP32 is used as client, select TCP SERVER mode for sketchWiFi.

When sketchWiFi selects TCP SERVER mode, ESP32 Sketch needs to be changed according to sketchWiFi's displaying of LOCAL IP or LOCAL PORT.

If ESP32 serves as server, select TCP CLIENT mode for sketchWiFi.

When sketchWiFi selects TCP CLIENT mode, the LOCAL IP and LOCAL PORT of sketchWiFi need to be changed according to the IP address and port number printed by the serial monitor.

Mode selection: select **Server mode/Client mode**.

IP address: In server mode, this option does not need to be filled in, and the computer will automatically obtain the IP address.

In client mode, fill in the remote IP address to be connected.

Port number: In server mode, fill in a port number for client devices to make an access connection.

In client mode, fill in port number given by the Server devices to make an access connection.

Start button: In server mode, push the button, then the computer will serve as server and open a port number for client to make access connection. During this period, the computer will keep monitoring.

In client mode, before pushing the button, please make sure the server is on, remote IP address and remote port number is correct; push the button, and the computer will make access connection to the remote port number of the remote IP as a client.

clear receive: clear out the content in the receiving text box

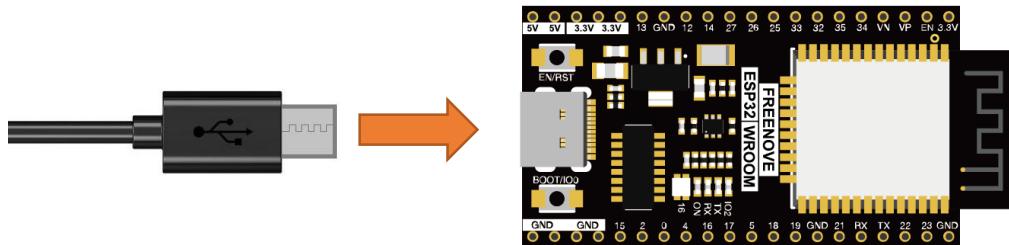

clear send: clear out the content in the sending text box

Sending button: push the sending button, the computer will send the content in the text box to others.

Circuit

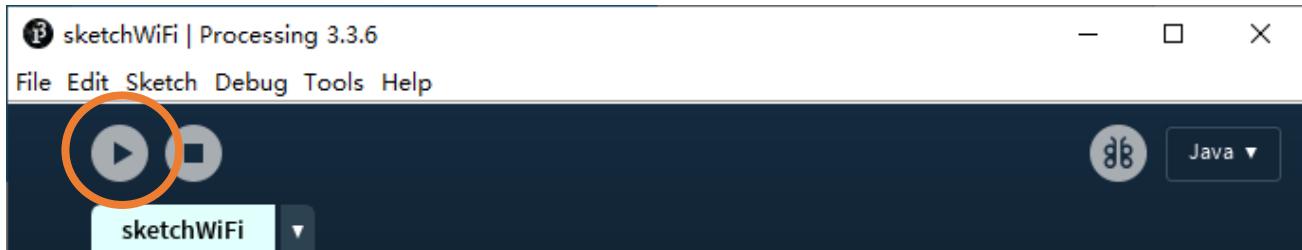

Connect Freenove ESP32 to the computer using USB cable.

Any concerns? [✉ support@freenove.com](mailto:support@freenove.com)

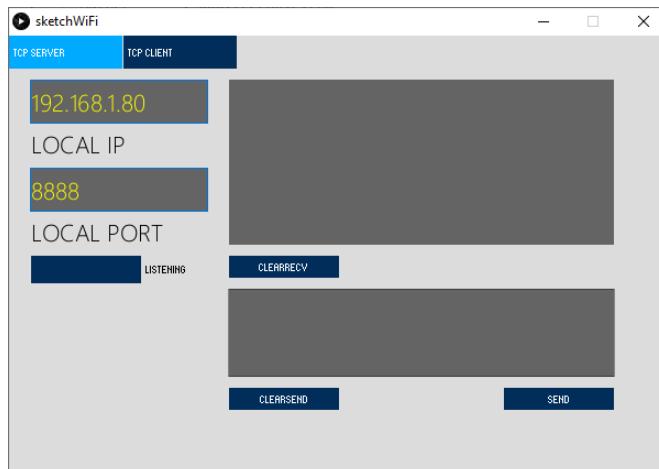

Sketch

Before running the Sketch, please open "sketchWiFi.pde." first, and click "Run".

The newly pop up window will use the computer's IP address by default and open a data monitor port.

Next, open Sketch_05.1_WiFiClient.ino. Before running it, please change the following information based on "LOCAL IP" and "LOCAL PORT" in the figure above.

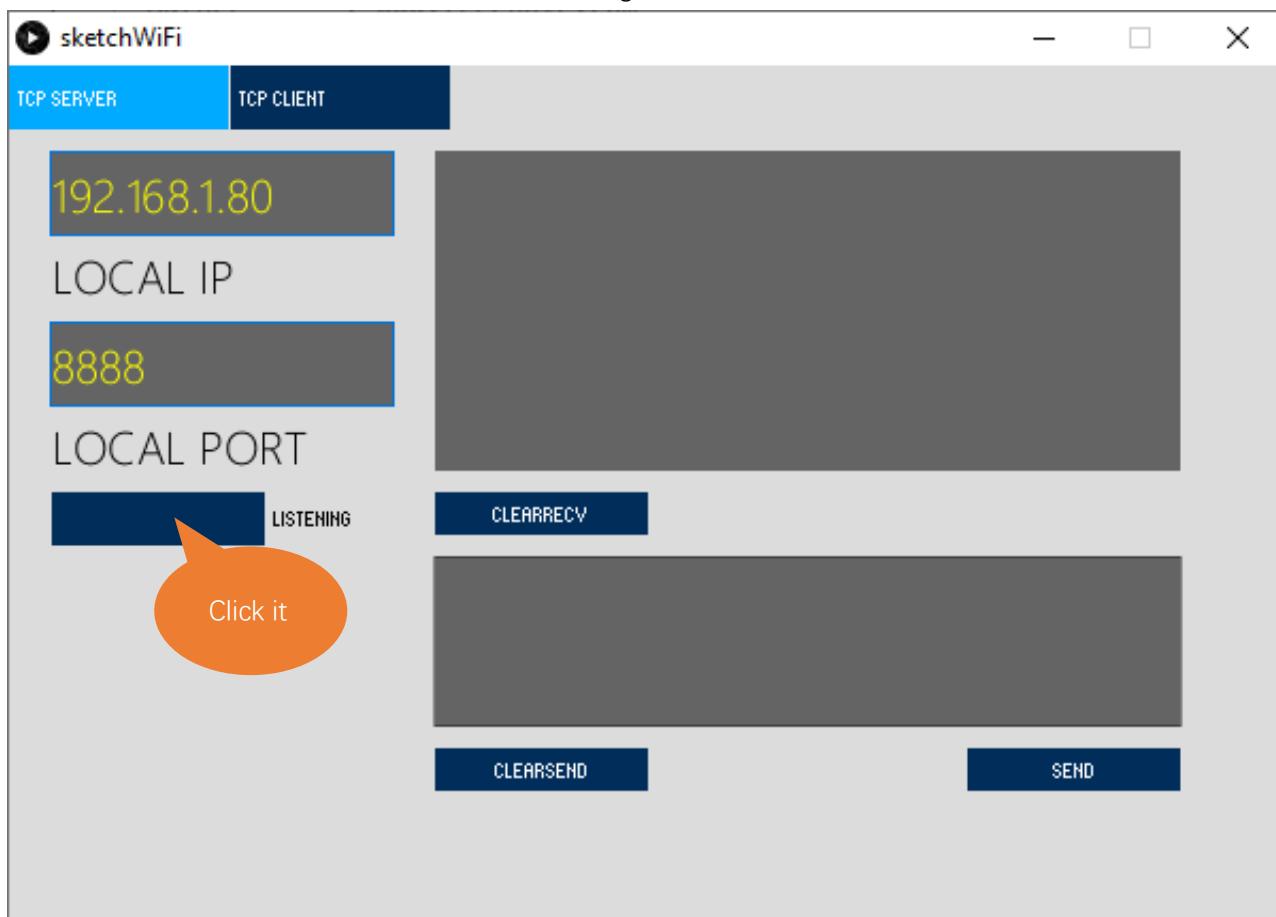

```

7 #include <WiFi.h>
8
9 const char *ssid_Router = "*****"; //Enter the router name
10 const char *password_Router = "*****"; //Enter the router password
11 #define REMOTE_IP "192.168.1.80" //input the remote server which is you want to connect
12 #define REMOTE_PORT 8888 //input the remote port which is the remote provide
13 WiFiClient client;

```

REMOTE_IP needs to be filled in according to the interface of sketchWiFi.pde. Taking this tutorial as an example, its REMOTE_IP is "192.168.1.80". Generally, by default, the ports do not need to change its value.

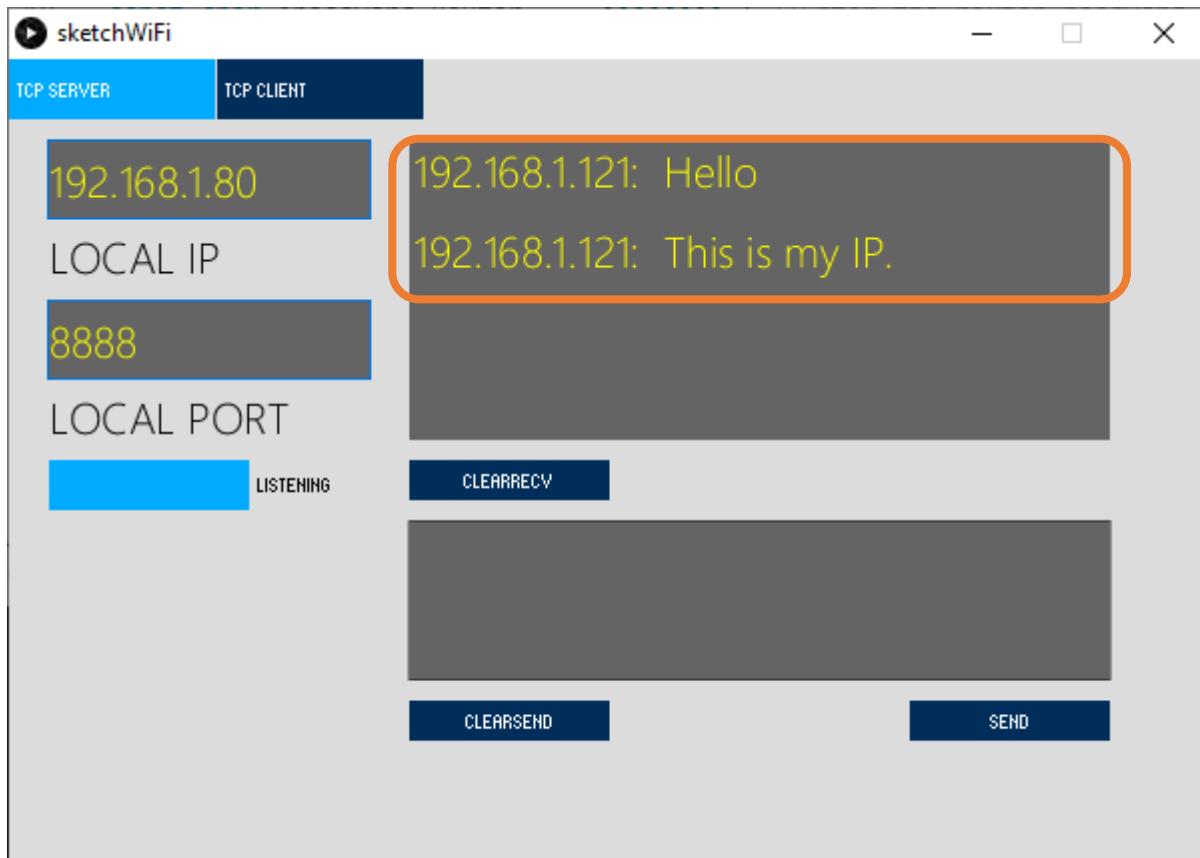

Click LISTENING, turn on TCP SERVER's data listening function and wait for ESP32 to connect.

Compile and upload code to ESP32-WROOM, open the serial monitor and set the baud rate to 115200. ESP32 connects router, obtains IP address and sends access request to server IP address on the same LAN till the connection is successful. When connect successfully, ESP32 can send messages to server.

ESP32 connects with TCP SERVER, and TCP SERVER receives messages from ESP32, as shown in the figure below.

Sketch_05.1_As Client

The following is the program code:

```
1 #include <WiFi.h>
2
3 const char *ssid_Router      = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
5 #define    REMOTE_IP        "*****"   //input the remote server which is you want to connect
6 #define    REMOTE_PORT       8888      //input the remote port which is the remote provide
7 WiFiClient client;
8
9 void setup() {
10     Serial.begin(115200);
11     delay(10);
12
13     WiFi.begin(ssid_Router, password_Router);
14     Serial.print("\nWaiting for WiFi... ");
15     while (WiFi.status() != WL_CONNECTED) {
16         Serial.print(".");
17         delay(500);
18     }
19     Serial.println("");
20     Serial.println("WiFi connected");
21     Serial.println("IP address: ");
22     Serial.println(WiFi.localIP());
23     delay(500);
24
25     Serial.print("Connecting to ");
26     Serial.println(REMOTE_IP);
27
28     while (!client.connect(REMOTE_IP, REMOTE_PORT)) {
29         Serial.println("Connection failed.");
30         Serial.println("Waiting a moment before retrying... ");
31     }
32     Serial.println("Connected");
33     client.print("Hello\n");
34     client.print("This is my IP.\n");
35
36 void loop() {
37     if (client.available() > 0) {
38         delay(20);
39         //read back one line from the server
40         String line = client.readString();
41         Serial.println(REMOTE_IP + String(":") + line);
```

```

42 }
43 if (Serial.available() > 0) {
44     delay(20);
45     String line = Serial.readString();
46     client.print(line);
47 }
48 if (client.connected () == 0) {
49     client.stop();
50     WiFi.disconnect();
51 }
52 }
```

Add WiFi function header file.

```
1 #include <WiFi.h>
```

Enter the actual router name, password, remote server IP address, and port number.

```

3 const char *ssid_Router      = "*****"; //Enter the router name
4 const char *password_Router = "*****"; //Enter the router password
5 #define    REMOTE_IP        "*****"   //input the remote server which is you want to connect
6 #define    REMOTE_PORT       8888      //input the remote port which is the remote provide
```

Apply for the method class of WiFiClient.

```
7 WiFiClient client;
```

Connect specified WiFi until it is successful. If the name and password of WiFi are correct but it still fails to connect, please push the reset key.

```

13 WiFi.begin(ssid_Router, password_Router);
14 Serial.print("\nWaiting for WiFi... ");
15 while (WiFi.status() != WL_CONNECTED) {
16     Serial.print(".");
17     delay(500);
18 }
```

Send connection request to remote server until connect successfully. When connect successfully, print out the connecting prompt on the serial monitor and send messages to remote server.

```

28 while (!client.connect(REMOTE_IP, REMOTE_PORT)) { //Connect to Server
29     Serial.println("Connection failed.");
30     Serial.println("Waiting a moment before retrying... ");
31 }
32 Serial.println("Connected");
33 client.print("Hello\n");
```

When ESP32 receive messages from servers, it will print them out via serial port; Users can also send messages to servers from serial port.

```

37 if (client.available() > 0) {
38     delay(20);
39     //read back one line from the server
40     String line = client.readString();
41     Serial.println(REMOTE_IP + String(":") + line);
42 }
```

```
43 if (Serial.available() > 0) {  
44     delay(20);  
45     String line = Serial.readString();  
46     client.print(line);  
47 }
```

If the server is disconnected, turn off WiFi of ESP32.

```
48 if (client.connected () == false) {  
49     client.stop();  
50     WiFi.disconnect();  
51 }
```

Reference

Class Client

Every time when using Client, you need to include header file "WiFi.h."

connect(ip, port, timeout)/connect(*host, port, timeout): establish a TCP connection.

ip, *host: ip address of target server

port: port number of target server

timeout: connection timeout

connected(): judge whether client is connecting. If return value is 1, then connect successfully; If return value is 0, then fail to connect.

stop(): stop tcp connection

print(): send data to server connecting to client

available(): return to the number of bytes readable in receive buffer, if no, return to 0 or -1.

read(): read one byte of data in receive buffer

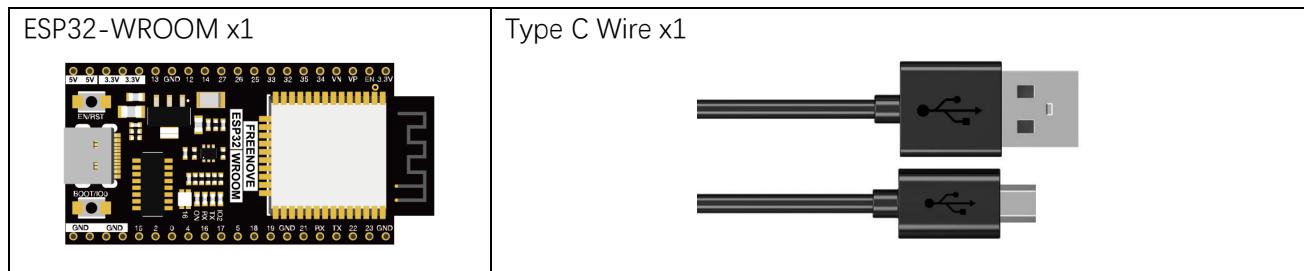

readString(): read string in receive buffer

Project 5.2 As Server

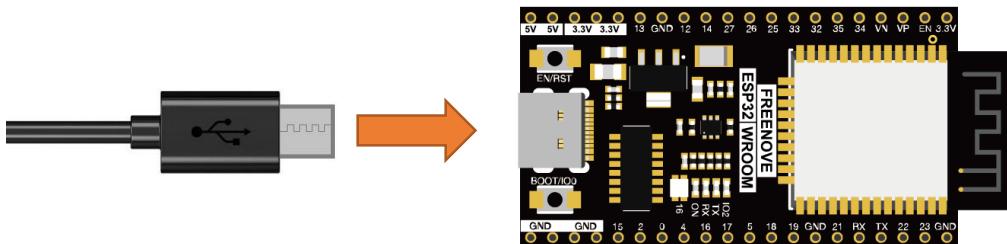

In this section, ESP32 is used as a server to wait for the connection and communication of client on the same LAN.

Component List

Circuit

Connect Freenove ESP32 to the computer using a USB cable.

Sketch

Before running Sketch, please modify the contents of the box below first.

Sketch_05.2_As_Server

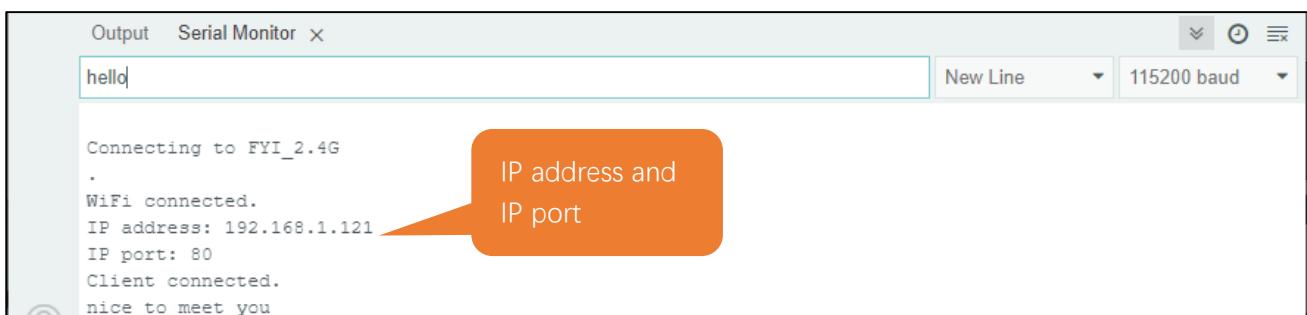

```
#include <WiFi.h>
#define port 80
const char *ssid_Router      = "*****"; //input your wifi name
const char *password_Router  = "*****"; //input your wifi passwords
WiFiServer server(port);
```

Compile and upload code to ESP32-WROOM board, open the serial monitor and set the baud rate to 115200. Turn on server mode for ESP32, waiting for the connection of other devices on the same LAN. Once a device connects to server successfully, they can send messages to each other.

If the ESP32 fails to connect to router, press the reset button as shown below and wait for ESP32 to run again.

```
09:09:32.062 -> e 'Ju9D2L0f&c7HH:0BffCh%Q_RQ*DUISI:STBSSISTMT_0*MH_SSUj
09:09:32.062 -> cKfffb2A%WP'Def, kEfsvffffO, fESS:ff0, dEsf:0ff0iSA_S.fffxbBf}frv'fA0fD}frf'SA0ffDqffff
09:09:32.093 -> f0ff f008!fa?
09:09:33.766 -> Connecting to FYI_2.4G
09:09:34.950 -> .....
```

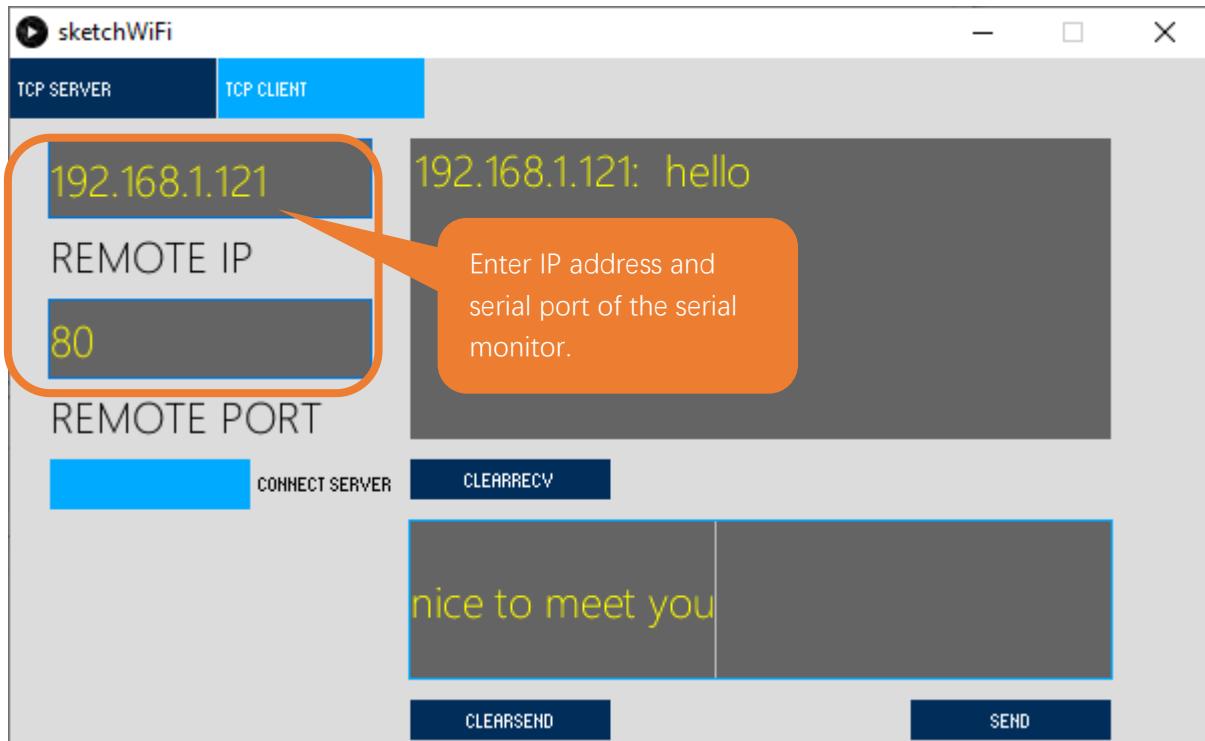

Serial Monitor

Processing:

Open the "Freenove_ESP32_WROOM_Board\Sketches\Sketches\Sketch_05.2_WiFiServer\sketchWiFi\sketchWiFi.pde".

Based on the messages printed by the serial monitor, enter correct IP address and IP port in Processing to establish connection and make communication.

The following is the program code:

```

1 #include <WiFi.h>
2
3 #define port 80
4 const char *ssid_Router      = "*****"; //input your wifi name
5 const char *password_Router  = "*****"; //input your wifi passwords
6 WiFiServer server(port);
7
8 void setup()
9 {
10    Serial.begin(115200);

```

```

11   Serial.printf("\nConnecting to ");
12   Serial.println(ssid_Router);
13   WiFi.disconnect();
14   WiFi.begin(ssid_Router, password_Router);
15   delay(1000);
16   while (WiFi.status() != WL_CONNECTED) {
17     delay(500);
18     Serial.print(".");
19   }
20   Serial.println("");
21   Serial.println("WiFi connected.");
22   Serial.print("IP address: ");
23   Serial.println(WiFi.localIP());
24   Serial.printf("IP port: %d\n", port);
25   server.begin(port);
26   WiFi.setAutoConnect(true);
27   WiFi.setAutoReconnect(true);
28 }
29
30 void loop() {
31   WiFiClient client = server.available();           // listen for incoming clients
32   if (client) {                                     // if you get a client
33     Serial.println("Client connected.");
34     while (client.connected()) {                   // loop while the client's connected
35       if (client.available()) {                   // if there's bytes to read from the
36         client.readStringUntil('\n');             // print it out the serial monitor
37         while(client.read()>0);                 // clear the wifi receive area cache
38       }
39       if(Serial.available()){                   // if there's bytes to read from the
39         Serial.println(client.readStringUntil('\n'));// print it out the serial monitor
40         client.print(Serial.readStringUntil('\n'));// print it out the client.
41         while(Serial.read()>0);                  // clear the wifi receive area cache
42       }
43     }
44     client.stop();                                // stop the client connecting.
45     Serial.println("Client Disconnected.");
46   }
47 }
```

Apply for method class of WiFiServer.

6	WiFiServer server(port); //Apply for a Server object whose port number is 80
---	--

Connect specified WiFi until it is successful. If the name and password of WiFi are correct but it still fails to connect, please push the reset key.

13	WiFi.disconnect();
----	--------------------

Any concerns? ✉ support@freenove.com

```

14   WiFi.begin(ssid_Router, password_Router);
15   delay(1000);
16   while (WiFi.status() != WL_CONNECTED) {
17     delay(500);
18     Serial.print(".");
19   }
20   Serial.println("");
21   Serial.println("WiFi connected.");

```

Print out the IP address and port number of ESP32.

```

22   Serial.print("IP address: ");
23   Serial.println(WiFi.localIP());           //print out IP address of ESP32
24   Serial.printf("IP port: %d\n", port);    //Print out ESP32's port number

```

Turn on server mode of ESP32, start automatic connection and turn on automatic reconnection.

```

25   server.begin();                      //Turn ON ESP32 as Server mode
26   WiFi.setAutoConnect(true);
27   WiFi.setAutoReconnect(true);

```

When ESP32 receive messages from servers, it will print them out via serial port; Users can also send messages to servers from serial port.

```

35   if (client.available()) {                // if there's bytes to read from the
      client
36       Serial.println(client.readStringUntil('\n'));// print it out the serial monitor
37       while(client.read()>0);                  // clear the wifi receive area cache
38   }
39   if(Serial.available()){                 // if there's bytes to read from the
      serial monitor
40       client.print(Serial.readStringUntil('\n'));// print it out the client.
41       while(Serial.read()>0);                  // clear the wifi receive area cache
42   }

```

Reference

Class Server

Every time use Server functionality, we need to include header file "WiFi.h".

WiFiServer(uint16_t port=80, uint8_t max_clients=4): create a TCP Server.

port: ports of Server; range from 0 to 65535 with the default number as 80.

max_clients: maximum number of clients with default number as 4.

begin(port): start the TCP Server.

port: ports of Server; range from 0 to 65535 with the default number as 0.

setNoDelay(bool nodelay): whether to turn off the delay sending functionality.

nodelay: true stands for forbidden Nagle algorithm.

close(): close tcp connection.

stop(): stop tcp connection.
